

Document Title

1M x 16 bit Dynamic RAM with EDO Page Mode

Revision History

<u>Revision No</u>	<u>History</u>	<u>Draft Date</u>	<u>Remark</u>
0A	Initial Draft	September 28,2001	

1M x 16 (16-MBIT) DYNAMIC RAM WITH EDO PAGE MODE

FEATURES

- Extended Data-Out (EDO) Page Mode access cycle
- TTL compatible inputs and outputs; tristate I/O
- Refresh Interval: 1,024 cycles /16 ms
- *Refresh Mode:*
 $\overline{\text{RAS}}$ -Only, $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ (CBR), and Hidden
- JEDEC standard pinout
- Single power supply:
5V \pm 10% (IC41C16100A(S))
3.3V \pm 10% (IC41LV16100A(S))
- Byte Write and Byte Read operation via two $\overline{\text{CAS}}$
- Self Refresh 1024 cycles for S version

DESCRIPTION

The *ICSI* IC41C16100A(S) and IC41LV16100A(S) are 1,048, 576 x 16-bit high-performance CMOS Dynamic Random Access Memories. These devices offer an accelerated cycle access called EDO Page Mode. EDO Page Mode allows 1,024 random accesses within a single row with access cycle time as short as 20 ns per 16-bit word. The Byte Write control, of upper and lower byte, makes the 16100 series ideal for use in 16-, 32-bit wide data bus systems.

These features make the IC41C16100A(S) and IC41LV16100A(S) ideally suited for high-bandwidth graphics, digital signal processing, high-performance computing systems, and peripheral applications.

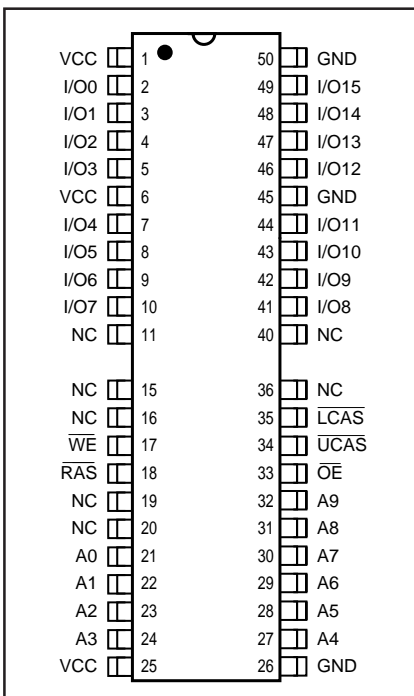

The IC41C16100A(S) and IC41LV16100A(S) are packaged in a 42-pin 400mil SOJ and 400mil 50- (44-) pin TSOP-2.

KEY TIMING PARAMETERS

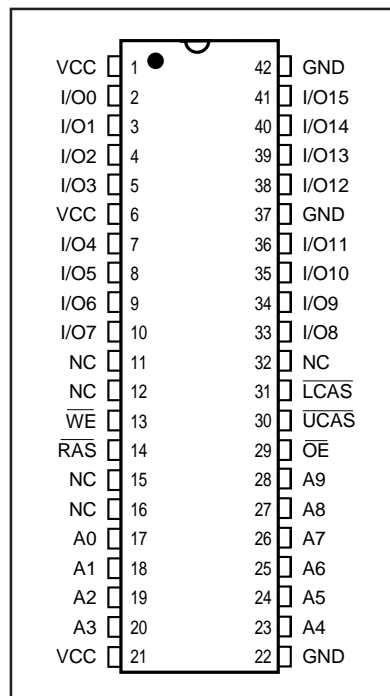

Parameter	-50	-60	Unit
Max. $\overline{\text{RAS}}$ Access Time (t_{RAC})	50	60	ns
Max. $\overline{\text{CAS}}$ Access Time (t_{CAC})	13	15	ns
Max. Column Address Access Time (t_{AA})	25	30	ns
Min. EDO Page Mode Cycle Time (t_{PC})	20	25	ns
Min. Read/Write Cycle Time (t_{RC})	84	104	ns

PIN CONFIGURATIONS

50(44)-Pin TSOP-2

42-Pin SOJ

PIN DESCRIPTIONS

A0-A9	Address Inputs
I/O0-15	Data Inputs/Outputs
$\overline{\text{WE}}$	Write Enable
$\overline{\text{OE}}$	Output Enable
$\overline{\text{RAS}}$	Row Address Strobe
$\overline{\text{UCAS}}$	Upper Column Address Strobe
$\overline{\text{LCAS}}$	Lower Column Address Strobe
Vcc	Power
GND	Ground
NC	No Connection

Notes:

1. These WRITE cycles may also be BYTE WRITE cycles (either $\overline{\text{LCAS}}$ or $\overline{\text{UCAS}}$ active).
2. These READ cycles may also be BYTE READ cycles (either $\overline{\text{LCAS}}$ or $\overline{\text{UCAS}}$ active).
3. EARLY WRITE only.
4. At least one of the two $\overline{\text{CAS}}$ signals must be active ($\overline{\text{LCAS}}$ or $\overline{\text{UCAS}}$).

Functional Description

The IC41C16100A(S) and IC41LV16100A(S) is a CMOS DRAM optimized for high-speed bandwidth, low power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 16 address bits. These are entered ten bits (A0-A9) at a time. The row address is latched by the Row Address Strobe ($\overline{\text{RAS}}$). The column address is latched by the Column Address Strobe (CAS). $\overline{\text{RAS}}$ is used to latch the first ten bits and CAS is used the latter ten bits.

The IC41C16100A(S) and IC41LV16100A(S) has two $\overline{\text{CAS}}$ controls, $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$. The $\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$ inputs internally generates a CAS signal functioning in an identical manner to the single CAS input on the other 1M x 16 DRAMs. The key difference is that each CAS controls its corresponding I/O tristate logic (in conjunction with $\overline{\text{OE}}$ and $\overline{\text{WE}}$ and $\overline{\text{RAS}}$). $\overline{\text{LCAS}}$ controls I/O0 through I/O7 and $\overline{\text{UCAS}}$ controls I/O8 through I/O15.

The IC41C16100A(S) and IC41LV16100A(S) $\overline{\text{CAS}}$ function is determined by the first $\overline{\text{CAS}}$ ($\overline{\text{LCAS}}$ or $\overline{\text{UCAS}}$) transitioning LOW and the last transitioning back HIGH. The two $\overline{\text{CAS}}$ controls give the IC41C16100A(S) and IC41LV16100A(S) both BYTE READ and BYTE WRITE cycle capabilities.

Memory Cycle

A memory cycle is initiated by bring $\overline{\text{RAS}}$ LOW and it is terminated by returning both RAS and CAS HIGH. To ensure proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum t_{RAS} time has expired. A new cycle must not be initiated until the minimum precharge time t_{RP} , t_{CP} has elapsed.

Read Cycle

A read cycle is initiated by the falling edge of $\overline{\text{CAS}}$ or $\overline{\text{OE}}$, whichever occurs last, while holding WE HIGH. The column address must be held for a minimum time specified by t_{AR} . Data Out becomes valid only when t_{RAC} , t_{AA} , t_{CAC} and t_{OEA} are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

Write Cycle

A write cycle is initiated by the falling edge of $\overline{\text{CAS}}$ and WE, whichever occurs last. The input data must be valid at or before the falling edge of $\overline{\text{CAS}}$ or WE, whichever occurs first.

Refresh Cycle

To retain data, 1,024 refresh cycles are required in each 16 ms period. There are two ways to refresh the memory.

1. By clocking each of the 1,024 row addresses (A0 through A9) with $\overline{\text{RAS}}$ at least once every 16 ms. Any read, write, read-modify-write or $\overline{\text{RAS}}$ -only cycle refreshes the addressed row.
2. Using a $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle. $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh is activated by the falling edge of $\overline{\text{RAS}}$, while holding $\overline{\text{CAS}}$ LOW. In $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh

cycle, an internal 10-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

Self Refresh Cycle

The Self Refresh allows the user a dynamic refresh, data retention mode at the extended refresh period of 128 ms. i.e., 125 μs per row when using distributed CBR refreshes. The feature also allows the user the choice of a fully static, low power data retention mode. The optional Self Refresh feature is initiated by performing a CBR Refresh cycle and holding $\overline{\text{RAS}}$ LOW for the specified t_{RAS} .

The Self Refresh mode is terminated by driving $\overline{\text{RAS}}$ HIGH for a minimum time of t_{RPS} . This delay allows for the completion of any internal refresh cycles that may be in process at the time of the $\overline{\text{RAS}}$ LOW-to-HIGH transition. If the DRAM controller uses a distributed refresh sequence, a burst refresh is not required upon exiting Self Refresh.

However, if the DRAM controller utilizes a $\overline{\text{RAS}}$ -only or burst refresh sequence, all 1,024 rows must be refreshed within the average internal refresh rate, prior to the resumption of normal operation.

Extended Data Out Page Mode

EDO page mode operation permits all 1,024 columns within a selected row to be randomly accessed at a high data rate.

In EDO page mode read cycle, the data-out is held to the next CAS cycle's falling edge, instead of the rising edge. For this reason, the valid data output time in EDO page mode is extended compared with the fast page mode. In the fast page mode, the valid data output time becomes shorter as the $\overline{\text{CAS}}$ cycle time becomes shorter. Therefore, in EDO page mode, the timing margin in read cycle is larger than that of the fast page mode even if the $\overline{\text{CAS}}$ cycle time becomes shorter.

In EDO page mode, due to the extended data function, the $\overline{\text{CAS}}$ cycle time can be shorter than in the fast page mode if the timing margin is the same.

The EDO page mode allows both read and write operations during one $\overline{\text{RAS}}$ cycle, but the performance is equivalent to that of the fast page mode in that case.

Power-On

After application of the Vcc supply, an initial pause of 200 μs is required followed by a minimum of eight initialization cycles (any combination of cycles containing a $\overline{\text{RAS}}$ signal).

During power-on, it is recommended that $\overline{\text{RAS}}$ track with Vcc or be held at a valid V_{IH} to avoid current surges.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Parameters	Rating	Unit	
V _T	Voltage on Any Pin Relative to GND	5V	-1.0 to +7.0	V
		3.3V	-0.5 to +4.6	
V _{CC}	Supply Voltage	5V	-1.0 to +7.0	V
		3.3V	-0.5 to +4.6	
I _{OUT}	Output Current	50	mA	
P _D	Power Dissipation	1	W	
T _A	Commercial Operation Temperature	0 to +70	°C	
T _{STG}	Storage Temperature	-55 to +125	°C	

Note:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED OPERATING CONDITIONS (Voltages are referenced to GND.)

Symbol	Parameter	Min.	Typ.	Max.	Unit	
V _{CC}	Supply Voltage	5V	4.5	5.0	5.5	V
		3.3V	3.0	3.3	3.6	
V _{IH}	Input High Voltage	5V	2.4	—	V _{CC} + 1.0	V
		3.3V	2.0	—	V _{CC} + 0.3	
V _{IL}	Input Low Voltage	5V	-1.0	—	0.8	V
		3.3V	-0.3	—	0.8	
T _A	Commercial Ambient Temperature	0	—	70	°C	

CAPACITANCE^(1,2)

Symbol	Parameter	Max.	Unit
C _{IN1}	Input Capacitance: A0-A9	5	pF
C _{IN2}	Input Capacitance: RAS, UCAS, LCAS, WE, OE	7	pF
C _{IO}	Data Input/Output Capacitance: I/O0-I/O15	7	pF

Notes:

1. Tested initially and after any design or process changes that may affect these parameters.
2. Test conditions: T_A = 25°C, f = 1 MHz.

ELECTRICAL CHARACTERISTICS⁽¹⁾

(Recommended Operating Conditions unless otherwise noted.)

Symbol	Parameter	Test Condition	Speed	Min.	Max.	Unit
I _{IL}	Input Leakage Current	Any input $0V \leq V_{IN} \leq V_{CC}$ Other inputs not under test = 0V		-5	5	μA
I _{IO}	Output Leakage Current	Output is disabled (Hi-Z) $0V \leq V_{OUT} \leq V_{CC}$		-5	5	μA

I _{CC2}	Standby Current: CMOS	$\overline{RAS}, \overline{LCAS}, \overline{UCAS} \geq V_{CC} - 0.2V$	5V 3.3V	— —	1 0.5	mA
I _{CC3}	Operating Current: Random Read/Write ^(2,3,4) Average Power Supply Current	$\overline{RAS}, \overline{LCAS}, \overline{UCAS}$, Address Cycling, t _{RC} = t _{RC} (min.)	-50 -60	— —	160 145	mA
I _{CC4}	Operating Current: EDO Page Mode ^(2,3,4) Average Power Supply Current	$\overline{RAS} = V_{IL}, \overline{LCAS}, \overline{UCAS}$, Cycling t _{PC} = t _{PC} (min.)	-50 -60	— —	90 80	mA
I _{CC5}	Refresh Current: \overline{RAS} -Only ^(2,3) Average Power Supply Current	\overline{RAS} Cycling, $\overline{LCAS}, \overline{UCAS} \geq V_{IH}$ t _{RC} = t _{RC} (min.)	-50 -60	— —	160 145	mA
I _{CC6}	Refresh Current: CBR ^(2,3,5) Average Power Supply Current	$\overline{RAS}, \overline{LCAS}, \overline{UCAS}$ Cycling t _{RC} = t _{RC} (min.)	-50 -60	— —	160 145	mA
I _{CCS}	Self Refresh Current	Self Refresh mode	5V 3.3V	— —	500 300	μA

Notes:

1. An initial pause of 200 μs is required after power-up followed by eight \overline{RAS} refresh cycles (\overline{RAS} -Only or CBR) before proper device operation is assured. The eight \overline{RAS} cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each EDO page cycle.
5. Enables on-chip refresh and address counters.

AC TEST CONDITIONS

Output load: Two TTL Loads and 50 pF (V_{CC} = 5.0V ±10%)
One TTL Load and 50 pF (V_{CC} = 3.3V ±10%)

Input timing reference levels: V_{IH} = 2.4V, V_{IL} = 0.8V (V_{CC} = 5.0V ±10%);
V_{IH} = 2.0V, V_{IL} = 0.8V (V_{CC} = 3.3V ±10%)

Output timing reference levels: V_{OH} = 2.0V, V_{OL} = 0.8V (V_{CC} = 5V ±10%, 3.3V ±10%)

Notes:

1. An initial pause of 200 μ s is required after power-up followed by eight $\overline{\text{RAS}}$ refresh cycle ($\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight $\overline{\text{RAS}}$ cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
4. If $\overline{\text{CAS}}$ and $\overline{\text{RAS}} = V_{\text{IH}}$, data output is High-Z.
5. If $\overline{\text{CAS}} = V_{\text{IL}}$, data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that $t_{\text{RCD}} < t_{\text{RCD}} (\text{MAX})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown.
8. Assumes that $t_{\text{RCD}} > t_{\text{RCD}} (\text{MAX})$.
9. If $\overline{\text{CAS}}$ is LOW at the falling edge of $\overline{\text{RAS}}$, data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer, $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ must be pulsed for t_{CP} .
10. Operation with the $t_{\text{RCD}} (\text{MAX})$ limit ensures that $t_{\text{RAC}} (\text{MAX})$ can be met. $t_{\text{RCD}} (\text{MAX})$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{\text{RCD}} (\text{MAX})$ limit, access time is controlled exclusively by t_{CAC} .
11. Operation within the $t_{\text{RAD}} (\text{MAX})$ limit ensures that $t_{\text{RCD}} (\text{MAX})$ can be met. $t_{\text{RAD}} (\text{MAX})$ is specified as a reference point only; if t_{RAD} is greater than the specified $t_{\text{RAD}} (\text{MAX})$ limit, access time is controlled exclusively by t_{AA} .
12. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
13. $t_{\text{OFF}} (\text{MAX})$ defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL} .
14. t_{WCS} , t_{RWD} , t_{AWD} and t_{CWD} are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If $t_{\text{WCS}} > t_{\text{WCS}} (\text{MIN})$, the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If $t_{\text{RWD}} > t_{\text{RWD}} (\text{MIN})$, $t_{\text{AWD}} > t_{\text{AWD}} (\text{MIN})$ and $t_{\text{CWD}} > t_{\text{CWD}} (\text{MIN})$, the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ or $\overline{\text{OE}}$ go back to V_{IH}) is indeterminate. $\overline{\text{OE}}$ held HIGH and $\overline{\text{WE}}$ taken LOW after $\overline{\text{CAS}}$ goes LOW result in a LATE WRITE ($\overline{\text{OE}}$ -controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding $\overline{\text{CAS}}$ input, I/O0-I/O7 by $\overline{\text{LCAS}}$ and I/O8-I/O15 by $\overline{\text{UCAS}}$.
16. During a READ cycle, if $\overline{\text{OE}}$ is LOW then taken HIGH before $\overline{\text{CAS}}$ goes HIGH, I/O goes open. If $\overline{\text{OE}}$ is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as $\overline{\text{WE}}$ going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and t_{OEH} met ($\overline{\text{OE}}$ HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if $\overline{\text{CAS}}$ remains LOW and $\overline{\text{OE}}$ is taken back to LOW after t_{OEH} is met.
19. The I/Os are in open during READ cycles once t_{OD} or t_{OFF} occur.
20. The first $\chi\overline{\text{CAS}}$ edge to transition LOW.
21. The last $\chi\overline{\text{CAS}}$ edge to transition HIGH.
22. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in EARLY WRITE cycles and $\overline{\text{WE}}$ leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23. Last falling $\chi\overline{\text{CAS}}$ edge to first rising $\chi\overline{\text{CAS}}$ edge.
24. Last rising $\chi\overline{\text{CAS}}$ edge to next cycle's last rising $\chi\overline{\text{CAS}}$ edge.
25. Last rising $\chi\overline{\text{CAS}}$ edge to first falling $\chi\overline{\text{CAS}}$ edge.
26. Each $\chi\overline{\text{CAS}}$ must meet minimum pulse width.
27. Last $\chi\overline{\text{CAS}}$ to go LOW.
28. I/Os controlled, regardless $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$.
29. The 3 ns minimum is a parameter guaranteed by design.
30. Enables on-chip refresh and address counters.

READ CYCLE

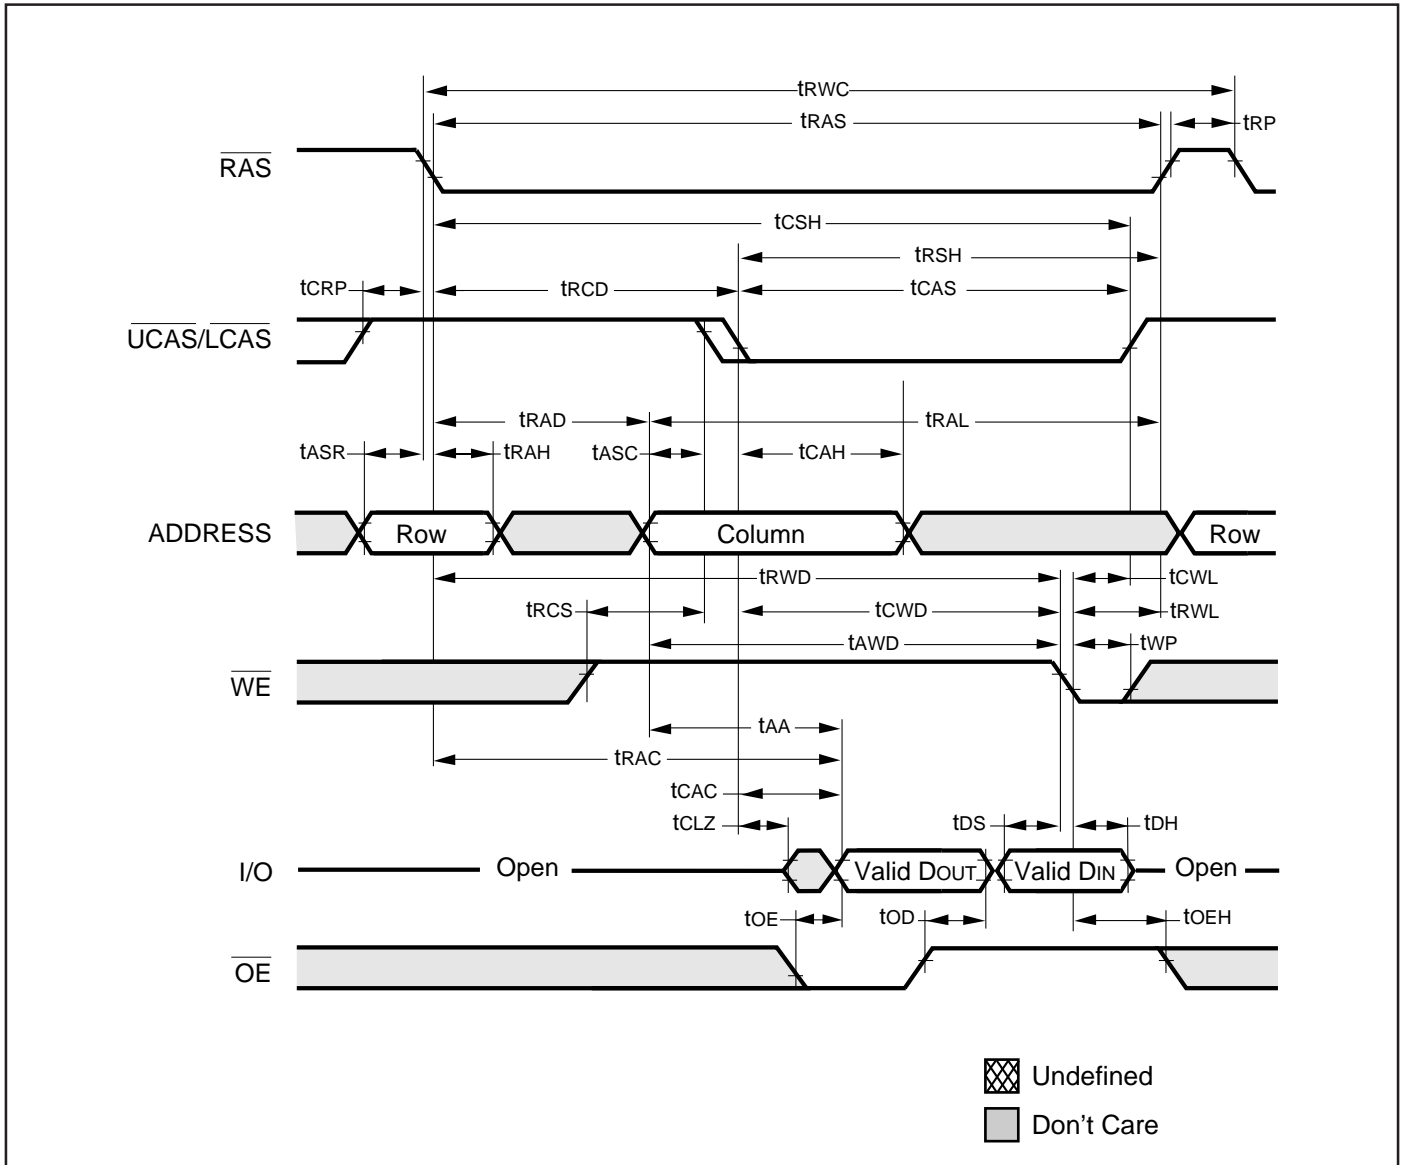

Note:

1. t_{OFF} is referenced from rising edge of \overline{RAS} or \overline{CAS} , whichever occurs last.

EARLY WRITE CYCLE (\overline{OE} = DON'T CARE)

READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE Cycles)

EDO-PAGE-MODE READ CYCLE

Note:

1. tpc can be measured from falling edge of $\overline{\text{CAS}}$ to falling edge of $\overline{\text{CAS}}$, or from rising edge of $\overline{\text{CAS}}$ to rising edge of $\overline{\text{CAS}}$. Both measurements must meet the tpc specifications.

EDO-PAGE-MODE EARLY-WRITE CYCLE

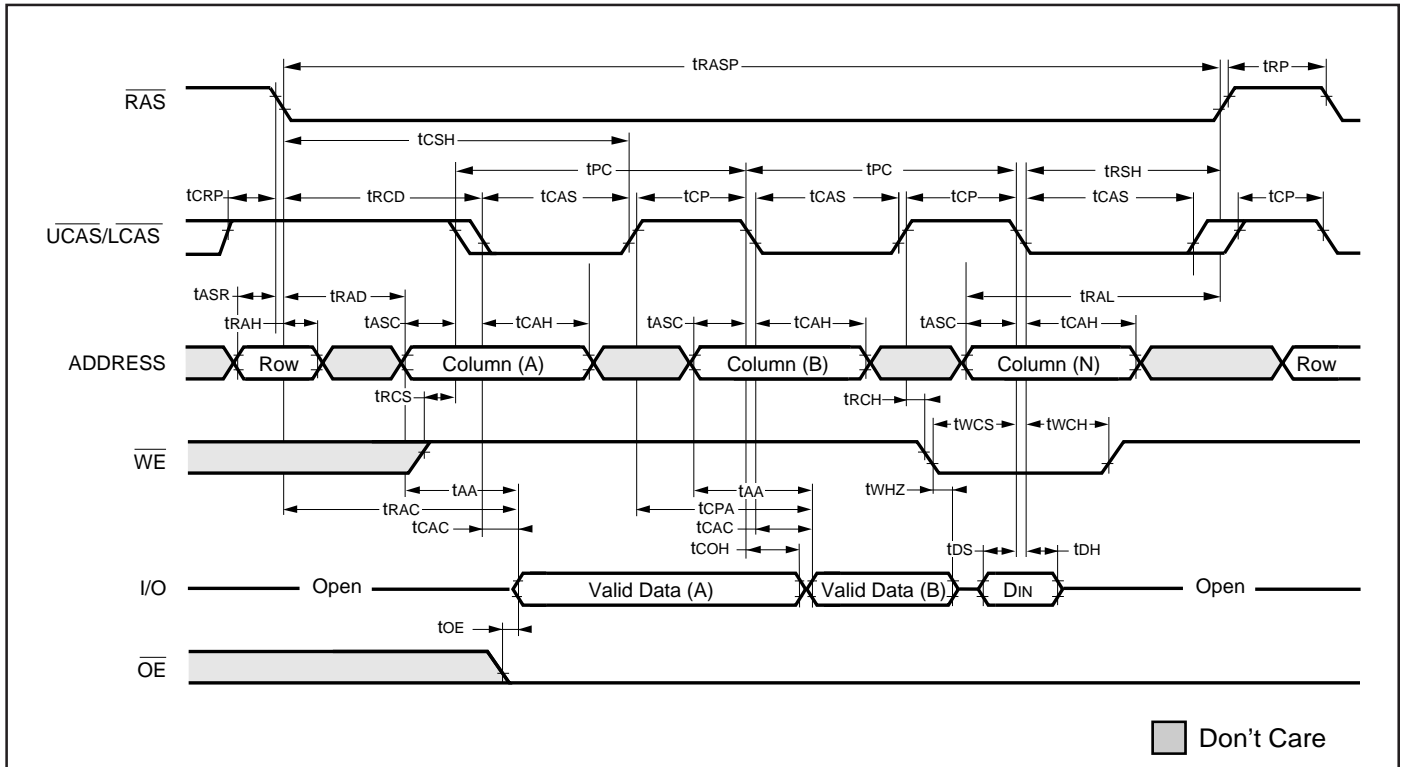

EDO-PAGE-MODE READ-WRITE CYCLE (LATE WRITE and READ-MODIFY WRITE Cycles)

Note:

1. t_{PC} is for LATE WRITE only. t_{PC} can be measured from falling edge of $\overline{\text{CAS}}$ to falling edge of $\overline{\text{CAS}}$, or from rising edge of $\overline{\text{CAS}}$ to rising edge of $\overline{\text{CAS}}$. Both measurements must meet the t_{PC} specifications.

EDO-PAGE-MODE READ-EARLY-WRITE CYCLE (Psuedo READ-MODIFY WRITE)

AC WAVEFORMS

READ CYCLE (With \overline{WE} -Controlled Disable)

RAS-ONLY REFRESH CYCLE (\overline{OE} , \overline{WE} = DON'T CARE)

CBR REFRESH CYCLE (Addresses; \overline{WE} , \overline{OE} = DON'T CARE)

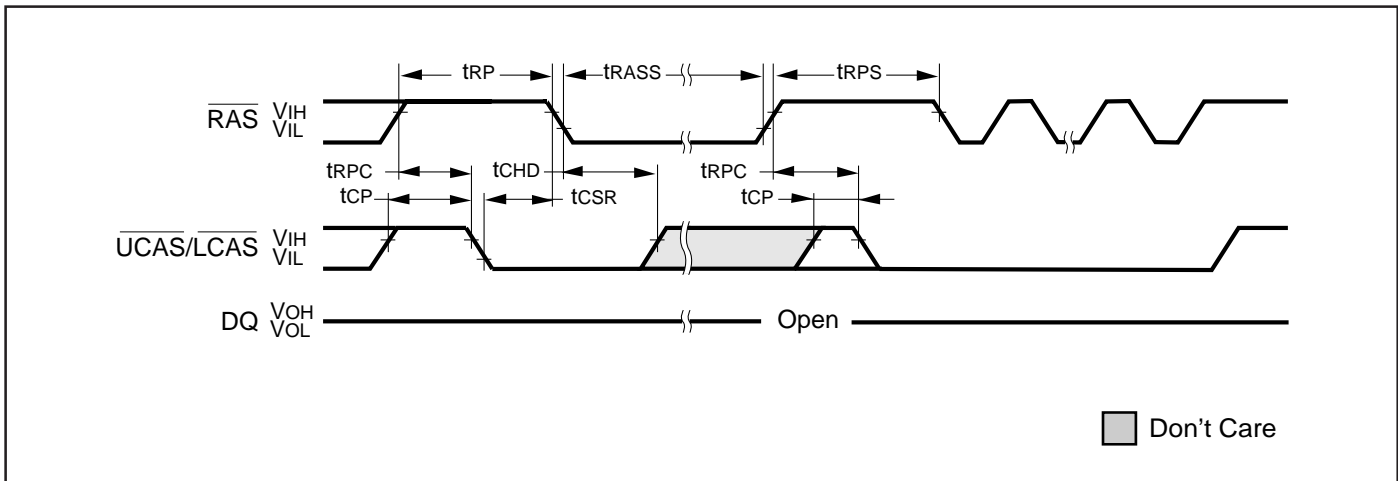

HIDDEN REFRESH CYCLE⁽¹⁾ (\overline{WE} = HIGH; \overline{OE} = LOW)

Notes:

1. A Hidden Refresh may also be performed after a Write Cycle. In this case, \overline{WE} = LOW and \overline{OE} = HIGH.
2. t_{OFF} is referenced from rising edge of \overline{RAS} or \overline{CAS} , whichever occurs last.

SELF REFRESH CYCLE (Addresses : \overline{WE} and \overline{OE} = DON'T CARE)

TIMING PARAMETERS

Symbol	-50		-60		Units
	Min.	Max.	Min.	Max.	
tCHD	8	—	10	—	ns
tCP	10	—	10	—	ns
tCSR	5	—	5	—	ns
tRASS	100	—	100	—	μs
tRP	30	—	40	—	ns
tRPS	84	—	104	—	ns
tRPC	5	—	5	—	ns
