### FUNCTIONAL BLOCK DIAGRAM

### GENERAL DESCRIPTION

The TMP10 is a low voltage, precision, centigrade temperature sensor and controller. A voltage output that is linearly proportional to the Celsius (Centigrade) temperature, the VPTAT output, provides temperature measurement from -40°C to +125°C. The output scale factor is +10 mV/°C. The TMP10 does not require external calibration to provide typical accuracies of ±1°C at 25°C and ±2°C over the operating temperature range. An open-collector output comparator, and an onboard 2.048 V reference allow a single temperature setpoint to be established using two external resistors. One of three levels of thermal hysteresis, 1°C, 2°C, or 5°C, may be chosen for the temperature setpoint using the hysteresis pin. The hysteresis level is determined by connecting the hysteresis pin to: V<sub>REF</sub>, GND, or leaving it floating. The TMP10 is designed for single supply operation from 2.7 V to 5.5 V. Supply current runs well below 100 µA providing very low self-heating, less than 0.1°C in still air. In addition, a shutdown function is provided to cut supply current to less than 1 µA for battery-powered applications. The TMP10 operates linearly up to +125°C from a single 2.7 V supply. Operation extends to +150°C with reduced accuracy when operating from a 5 V supply.

The TMP10 is available in 8-pin DIP, and SO-8 and TSSOP-8 surface-mount packages.
