

High Efficiency, No Heatsink, Isolated DC/DC Converter

The PQ48025QNA25 PowerQor™ quarter brick converter is a next-generation, board-mountable, isolated, fixed switching frequency dc/dc converter that uses synchronous rectification to achieve extremely high conversion efficiency. The power dissipated by the converter is so low that a heatsink is not required, which saves cost, weight, height, and application effort. All of the power and control components are mounted to the multi-layer PCB substrate with high-yield surface mount technology. Since the PowerQor converter has no explicit thermal connections, it is extremely reliable.

PowerQor™

PQ48025QNA25 Module

Operational Features

- Ultra-high efficiency, 86% at full rated load current
- Delivers up to 25 amps of output current with minimal derating - no heatsink required
- Wide input voltage range: 35V – 75V meets or exceeds all 48V bus standards
- Fixed frequency switching provides predictable EMI performance
- No minimum load requirement means no preload resistors required

Mechanical Features

- Industry standard pin-out configuration (pin for pin compatible with Lucent QHW series)
- Industry standard size: 1.45" x 2.3"
- Total height less than 0.40", permits better airflow and smaller card pitch
- Total weight: 34 grams (1.2 oz.), lower mass greatly reduces vibration and shock problems

Safety Features

- 2000V, 10 MΩ input-to-output isolation provides input/output ground separation
- UL 1950 recognized (US & Canada), basic insulation rating
- TUV certified to EN60950

Protection Features

- Input under-voltage lockout disables converter at low input voltage conditions
- Output current limit and short circuit protection protects converter from excessive load current or short circuits
- Output over-voltage protection protects load from damaging voltages
- Thermal shutdown protects converter from abnormal environmental conditions

Control Features

- On/Off control referenced to input side (positive and negative logic options are available)
- Remote sense for the output voltage compensates for output distribution drops
- Output voltage trim: +10%/-20%, permits custom voltages and voltage margining

Safety Features (cont.)

- Meets 72/23/EEC and 93/68/EEC directives which facilitates CE Marking in user's end product
- Board and plastic components meet 94V-0 flammability requirements

Shown Actual Size

- 1) All dimensions in inches (mm)
- 2) Pins 1-3, 5-7 are 0.040" (1.02mm) dia. with 0.080" (2.03mm) dia. standoff shoulders.
- 3) Pins 4 and 8 are 0.062" (1.57 mm) dia. with 0.100" (2.54mm) dia. standoff shoulders.
- 4) All pins are Brass with Tin/Lead plating over Nickel
- 5) Tolerances: x.xx in. +/-0.02 in. (0.5mm)
x.xxx in. +/-0.010 in. (0.25mm)
- 6) Weight: 1.20 oz. (34 g)
- 7) Workmanship: Meets or exceeds IPC-A-610B Class II

Pin No.	Name	Function
1	Vin(+)	Positive input voltage (35V - 75V)
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
3	Vin(-)	Negative input voltage
4	Vout(-)	Negative output voltage
5	SENSE(-)	Negative remote sense ¹
6	TRIM	Output voltage trim ²
7	SENSE(+)	Positive remote sense ³
8	Vout(+)	Positive output voltage

ABSOLUTE MAXIMUM RATINGS

Input Voltage:
 Non-Operating: 100V continuous
 Operating: 80V continuous
 100V 10µs transients, 1% duty cycle

Input/Output Isolation Voltage: 2000V

Storage Temperature: -55°C to +125°C

Operating Temperature: -40°C to +115°C

Voltage at ON/OFF input pin: +18V / -2V

Notes:

1. Pin 5 must be connected to Vout(-) at load.
2. Leave Pin 6 open for nominal output voltage.
3. Pin 7 must be connected to Vout(+) at load.

OPTIONS

The PQ48025QNA25 comes in two versions that differ by the sense of the logic used for the ON/OFF control signal. The PQ48025QNA25P version uses positive logic; meaning that the converter is on when the ON/OFF signal (Pin 2) is high. The PQ48025QNA25N version uses negative logic; the converter is on when the ON/OFF signal is low. Logic input is TTL compatible with an internal pull up.

Patents: SynQor is protected under various patents, including but not limited to U.S. Patent # 5,999,417.

SAFETY

The PQ48025QNA25 series of converters are UL 1950 recognized (US & Canada) with basic insulation rating and TUV certified to EN60950 requirements.

The converters also meet 72/23/EEC and 93/68/EEC directives as well as 94V-0 flammability requirements for board and plastic components.

An external input fuse must always be used to meet these safety requirements.

PQ48025QNA25 ELECTRICAL CHARACTERISTICS

(T_A=25°C, airflow rate=300 LFM, V_{in}=48Vdc unless otherwise noted; full operating temperature range is -40°C to +115°C ambient temperature with appropriate power derating.)

BASIC OPERATION AND FEATURES

The *PowerQor* series converter uses a two-stage power circuit topology. The first stage is a buck-converter that keeps the output voltage constant over variations in line, load, and temperature. The second stage uses a transformer to provide the functions of input/output isolation and voltage step-down to achieve the low output voltage required.

Both the first stage and the second stage switch at a fixed frequency for predictable EMI performance. Rectification of the transformer's output is accomplished with synchronous rectifiers. These devices, which are MOSFETs with a very low on-state resistance, dissipate far less energy than Schottky diodes used in conventional dc/dc converters. This is the primary reason that the *PowerQor* converter has such high efficiency—even at very low output voltages and very high output currents.

Dissipation throughout the converter is so low that the **PowerQor converter requires no heatsink** to deliver a greater level of power than can be delivered by a conventional, Schottky-diode-based dc/dc converter with a 0.5" high heatsink. At equivalent ambient air temperature, airflow rate, and output power level, the hottest semiconductor junction temperature and the hottest PCB temperature within the *PowerQor* converter are cooler than those found in conventional dc/dc converters with a 0.5" high heatsink attached.

Since a heatsink is not required, the *PowerQor* converter does not need a metal baseplate or potting material to help conduct the dissipated energy to the heatsink. The *PowerQor* converter can thus be built more simply using high yield surface mount techniques on a PCB substrate.

Unlike conventional dc/dc converters, which have critical thermal connections between the power components and the baseplate, and between the baseplate and the heatsink, the *PowerQor* converter has no explicit, failure-prone thermal connections.

Compared to a conventional Schottky-diode-based dc/dc converter with a 0.5" high heatsink, the *PowerQor* converter is more efficient and therefore it dissipates less than half the energy. Additionally, because the *PowerQor* converter is thinner (0.4" vs. 1.0"), the board-to-board pitch in a rack can be much smaller, and cooling airflow is less impeded by

the converter. Because the *PowerQor* converter is much lighter, vibration and shock-induced problems are greatly reduced. Moreover, due to the lack of failure-prone explicit thermal connections and the lack of potting material the *PowerQor* converter is more reliable than conventional dc/dc converters.

The *PowerQor* series converter uses the industry standard pin-out configuration used by other vendors of comparably sized and rated dc/dc converters. The unit is pin for pin compatible with the Lucent QW series.

The *PowerQor* converter has many standard control and protection features. All shutdown features are non-latching, meaning that the converter shuts off for 200ms before restarting. (see *Figure F*)

- An **ON/OFF** input permits the user to control when the converter is *on* and *off* in order to properly sequence different power supplies and to reduce power consumption during a standby condition.
- **Remote sense** inputs permit the user to maintain an accurate voltage at the load despite distribution voltage drops between the converter's output and the load.
- An **output voltage trim** input permits the user to trim the output voltage up or down to achieve a custom voltage level or to do voltage margining.
- An **input under-voltage lockout** avoids input system instability problems while the input voltage is rising.
- The **output current limit** protects both the converter and the board on which it is mounted against a short circuit condition.
- An **output over-voltage limit** circuit shuts the unit down if the output voltage at the output pins gets too high.
- A sensor located in a central spot of the PCB provides a **PCB temperature limit**. If, due to an abnormal condition, this spot gets too hot, the converter will turn off. Once the converter has cooled, it will automatically turn on again without the need to recycle the input power.

CONTROL PIN DESCRIPTIONS

Pin 2 (ON/OFF): The ON/OFF input, Pin 2, permits the user to control when the converter is *on* or *off*. This input is

referenced to the return terminal of the 48V input bus. There are two versions of the PowerQor series converter that differ by the sense of the logic used for the ON/OFF input. In the PQxyyyQNAzzPxx version, the ON/OFF input is active high (meaning that a high turns the converter on). In the PQxyyyQNAzzNxx version, the ON/OFF signal is active low (meaning that a low turns the converter on). Figure A details five possible circuits for driving the ON/OFF pin.

Pins 7 and 5 (SENSE(±)): The SENSE(±) inputs correct for voltage drops along the conductors that connect the converter's output pins to the load.

Pin 7 should be connected to Vout(+) and Pin 5 should be connected to Vout(-) at the point on the board where regulation is desired. That is,

$$[V_{out(+)} - V_{out(-)}] - [SENSE(+)-SENSE(-)] \leq 10\%V_{out}$$

Pins 7 and 5 must be connected for proper regulation of the output voltage. However, if these connections are not made, nothing catastrophic will happen to the converter under normal operating conditions—the converter will simply deliver an output voltage that is slightly higher than its specified value.

Note: the output over-voltage protection circuit senses the voltage across the output (pins 8 and 4) to determine when

it should trigger, not the voltage across the converter's sense pins (pins 7 and 5). Therefore, the resistive drop on the board should be small enough so that output OVP does not trigger, even during load transients.

Pin 6 (TRIM): The TRIM input permits the user to adjust the output voltage across the sense leads up or down. To lower the output voltage, the user should connect a resistor between Pin 6 and Pin 5, which is the SENSE(-) input. To raise the output voltage, the user should connect a resistor between Pin 6 and Pin 7, which is the SENSE(+) input.

A resistor connected between Pin 6 and Pin 5 will decrease the output voltage. For a desired decrease of Δ percent of the nominal output voltage, the value of this resistor should be

$$R_{trim-down} = \left(\frac{511}{\Delta\%} \right) - 10.22 \text{ (k}\Omega\text{)}$$

where

$$\Delta = \left(\frac{V_{NOM} - V_{DES}}{V_{NOM}} \right) \times 100\%$$

and

V_{NOM} = Nominal Voltage

V_{DES} = Desired Voltage

Figure A: Various circuits for driving the ON/OFF pin.

Figure B graphs this relationship between $R_{\text{trim-down}}$ and Δ . The output voltage can be trimmed down as much as 20%.

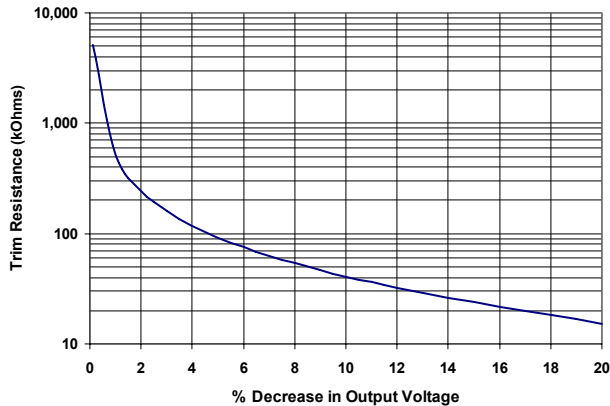

Figure B: Trim Down Graph for 2.5V_{out}

A resistor connected between Pin 6 and Pin 7 will increase the output voltage. For a desired increase of Δ percent of the nominal output voltage, the value of this resistor should be

$$R_{\text{trim-up}} = \left(\frac{5.11V_{\text{OUT}}(100+\Delta\%)}{1.225\Delta\%} - \frac{511}{\Delta\%} - 10.22 \right) (\text{k}\Omega)$$

where

$$V_{\text{OUT}} = \text{Nominal Output Voltage}$$

Figure C graphs this relationship between $R_{\text{trim-up}}$ and Δ . The output voltage can be trimmed up as much as 10%.

Figure C: Trim Up Graph for 2.5V_{out}

Note: the TRIM feature does not affect the voltage at which the output over-voltage protection circuit is triggered. Trimming the output voltage too high may cause the over-voltage protection circuit to engage, particularly during transients.

TOTAL DC VARIATION OF V_{out}: For the converter to meet its full specifications, the maximum variation of the dc value of V_{out}, due to both trimming and remote load voltage drops, should not be greater than +10%/-20%

PROTECTION FEATURES

Input Under-Voltage Lockout: The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail below. The lockout circuitry is a comparator with dc hysteresis. When the input voltage is rising, it must exceed a typical value of 33V before the converter will turn on. Once the converter is on, the input voltage must fall below a typical value of 29.5V before the converter will turn off.

Output Current Limit: The current limit does not change appreciably as the output voltage drops. However, once the impedance of the short across the output is small enough to make the output voltage drop below approximately 60% of its nominal value, the converter turns off.

The converter then enters a mode where it repeatedly turns on and off at a 5 Hz (nominal) frequency with a 5% duty cycle until the short circuit condition is removed. This prevents excessive heating of the converter or the load board (see Figure 18).

Output Over-Voltage Limit: If the voltage across the output pins exceeds the O.V. threshold, the converter will immediately stop switching. This prevents damage to the load circuit due to 1) a sudden unloading of the converter, 2) a release of a short-circuit condition, or 3) a release of a current limit condition. Load capacitance determines exactly how high the output voltage will rise in response to these conditions. After 200 ms the converter will automatically restart.

Thermal Shutdown: The PowerQor series has a temperature sensor located such that it senses the average temperature of the converter. The thermal shutdown circuit is designed to turn the converter off when the temperature at

the sensed location reaches 115°C. It will allow the converter to turn on again when the temperature of the sensed location falls below 110°C.

APPLICATION CONSIDERATIONS

Input System Instability: This condition can occur because a dc/dc converter appears incrementally as a negative resistance load. A detailed application note titled "Input System Instability" is available on the SynQor web site (www.synqor.com) which provides an understanding of why this instability arises, and shows the preferred solution for correcting it.

Application Circuits: Figure D below provides a typical circuit diagram which is useful when using input filtering and voltage trimming. Figure E is a detailed look of the internal ON/OFF circuitry that is shown in Figure A.

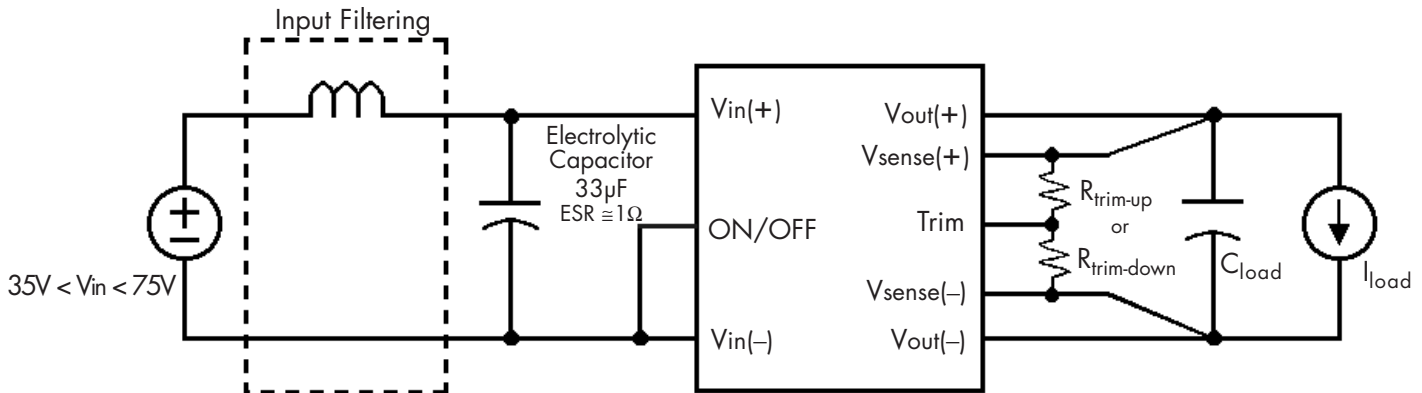

Figure D: Typical application circuit (negative logic unit, permanently enabled).

Figure E: Internal ON/OFF pin circuitry

STARTUP INHIBIT PERIOD

The Startup Inhibit Period ensures that the converter will remain off for at least 200ms when it is shut down for any reason. When an output short is present, this generates a 5Hz "hiccup mode," which prevents the converter from overheating. In all, there are seven ways that the converter can be shut down, initiating a Startup Inhibit Period:

- Input Under-Voltage Lockout
- Input Over-Voltage Shutdown (not present in Quarter-brick)
- Output Over-Voltage Protection
- Over Temperature Shutdown
- Current Limit
- Short Circuit Protection
- Turned off by the ON/OFF input

Figure F shows three turn-on scenarios, where a Startup Inhibit Period is initiated at t_0 , t_1 , and t_2 :

Before time t_0 , when the input voltage is below 34V (typ.), the unit is disabled by the Input Under-Voltage Lockout feature. When the input voltage rises above 34V, the Input Under-Voltage Lockout is released, and a Startup Inhibit Period is initiated. At the end of this delay, the ON/OFF pin is evaluated, and since it is active, the unit turns on.

At time t_1 , the unit is disabled by the ON/OFF pin, and it cannot be enabled again until the Startup Inhibit Period has elapsed.

When the ON/OFF pin goes high after t_2 , the Startup Inhibit Period has elapsed, and the output turns on within the 4ms (typ.) "Turn On Time."

Figure F: Startup Inhibit Period (turn-on time not to scale)

Technical Specification

Quarter Brick **48V_{in} 2.5V_{out} 25A**

PART NUMBERING SYSTEM

The part numbering system for SynQor's PowerQor DC/DC converters has the following format:

Quarter-Brick Product Family and Part Numbering Scheme									
Product Family	Input Voltage	Output Voltage	Package Size	Performance Series	Thermal Design	"Rated" Output Current	Pos./Neg. Logic	Pin Length	Features
PQ	48	033	Q	N	A	25	N	N	S
PQ - PowerQor	48 - (35v-75v)	015 - 1.5V	Q - Quarter Brick	N - Normal	A - Open Frame B - Baseplate	25 - 25 Amps	P - Positive N - Negative	K - 0.110" N - 0.145" R - 0.180" Y - 0.250"	S - Standard
		018 - 1.8V							
		020 - 2.0V							
		025 - 2.5V							
		033 - 3.3V							
		050 - 5.0V							
		060 - 6.0V							
		120 - 12V							
150 - 15V									
<i>Base Part Number</i>							<i>Options</i>		

Example part #: PQ48033QNA25NNS

This part number indicates a PowerQor converter with 48V_{in}, 3.3V_{out}, quarter-brick size, normal performance level, open air design, 25 amps output current, negative logic, 0.145" pins, and the standard feature set.

When ordering SynQor converters, please ensure that you use the complete 15 character part number.
