**Electrical Characteristics:**

**Times vs current characteristics**

The following curves indicate the pre-arcing time for each rated current as a function of RMS value of pre-arcing current I:

- Tolerances on this current  $\pm 8\%$
- Beyond 30 sec or 10 sec, small overloads must be eliminated by another device.
- 

Curve CC' represents the maximum times taken by the associated device to clear small overloads; only its horizontal line is represented.

Its oblique line must be plotted according to sketch in top right corner:

- The intersection of the fuse and CC' curves indicates the minimum breaking current  $I_{pm}$  of the fuse.

**Total clearing I<sup>2</sup>T:**

The horizontal curves given below indicated the maximum values of total operating I<sup>2</sup>t (I<sup>2</sup>t<sub>t</sub>) as a function of prospective current I<sub>p</sub> @ 660V, cosφ = 0.15. Oblique lines indicate the corresponding total operating time T<sub>t</sub>, with pre-arcing time in brackets.

**Cut off Characteristics:**

The curves below indicate, for each rated current, the peak value  $I_c$  that the current may reach as a function of the prospective fault current  $I_p$ .

### I<sup>2</sup>t Multiplier Coefficient

The above Mean curve shows variation of total clearing time ( $I^2t_t$ ) and total operating time  $T_t$  in accordance with working voltage  $U$ .

### Peak Arc Voltage

Curve indicating peak arc voltage  $U_m$  which may appear across fuse terminals as a function of working voltage  $U$  @  $\cos \varphi = 0.15$ .

### Dissipated Power

Curve enabling calculation of dissipated power  $P$  by a fuse rated  $I_N$ , as a function of the RMS current  $I$ , in multiples of  $I_N$  in a steady state.
