HIGH-CURRENT HALF-BRIDGE POWER DRIVER

The UDN2955W-2 half-bridge power driver combines a high-current, half-bridge power driver with low-level control and protection circuitry. For PWM applications there are provisions for output current sensing and an ENABLE (active low) input. The output can source or sink up to 6 A continuously. This device features a minimum break-down and sustaining voltage of 40 V. It can be used in pairs for full-bridge operation or in triplets for 3-phase brushless dc motors.

Protection is included which shuts down the device during over-temperature conditions caused by loss of cooling; internal flyback and clamp diodes are included for switching inductive loads. Internal logic lockout and delays prevent potentially destructive crossover currents. The logic inputs are compatible with TTL and 5 V CMOS logic systems.

A similar device, excluding the ENABLE and output current sensing provision, in a 5-lead TO-220 style package, is the UDN2951Z-2.

The UDN2955W-2 is supplied in a 12-lead power-tab single in-line plastic package. The tab is at ground potential, allowing multiple devices to share a common heat sink.

FEATURES

- ± 6 A Continuous Output Current
- Output Voltage to 40 V
- Internal Thermal Shutdown
- TTL and 5 V CMOS Compatible Inputs
- Integral Transient-Suppression Diodes

ABSOLUTE MAXIMUM RATINGS at $T_j \leq 150^\circ\text{C}$

- Supply Voltage, V_S 40 V
- Output Current, I_{OUT} ±6.0 A
- Input Voltage, V_{IN} 7.0 V
- Sense Voltage, V_{SENSE} 1.5 V
- Package Power Dissipation,
 P_D See Graph
- Operating Temperature Range,
 T_A -20°C to + 85°C
- Storage Temperature Range,
 T_S -55°C to + 150°C

Output current rating may be limited by duty cycle, ambient temperature, and heat sinking. Under any set of conditions, do not exceed the specified output current rating or a junction temperature of +150°C.

TYPICAL APPLICATION

The printed wiring board should utilize a heavy ground plane. For optimum performance, the driver should be soldered directly into the board. The power supply (V_{CC}) should be decoupled with an electrolytic capacitor ($\geq 10 \mu\text{F}$) as close as possible to pin 2.
