

## F100136 4-Stage Counter/Shift Register

### General Description

The F100136 operates as either a modulo-16 up/down counter or as a 4-bit bidirectional shift register. Three Select ( $S_n$ ) inputs determine the mode of operation, as shown in the Function Select table. Two Count Enable ( $\overline{CEP}$ ,  $\overline{CET}$ ) inputs are provided for ease of cascading in multistage counters. One Count Enable ( $\overline{CET}$ ) input also doubles as a Serial Data ( $D_0$ ) input for shift-up operation. For shift-down operation,  $D_3$  is the Serial Data input. In counting operations the Terminal Count ( $\overline{TC}$ ) output goes LOW when the counter reaches 15 in the count/up mode or 0 (zero) in the count/down mode. In the shift modes, the  $\overline{TC}$  output repeats the  $Q_3$  output. The dual nature of this  $\overline{TC}/Q_3$  output and the  $D_0/\overline{CET}$  input means that one interconnection from one stage to the next higher stage serves as the link for

multistage counting or shift-up operation. The individual Pre-set ( $P_n$ ) inputs are used to enter data in parallel or to preset the counter in programmable counter applications. A HIGH signal on the Master Reset ( $\overline{MR}$ ) input overrides all other inputs and asynchronously clears the flip-flops. In addition, a synchronous clear is provided, as well as a complement function which synchronously inverts the contents of the flip-flops. All inputs have 50 k $\Omega$  pull-down resistors.

Refer to the F100336 datasheet for:

- PCC packaging
- Lower power
- Military versions
- Extended voltage specs (-4.2V to -5.7V)

**Ordering Code:** See Section 8

**Note 1:** Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 2:** Parametric values specified at  $-4.2\text{V}$  to  $-4.8\text{V}$ .

**Note 3:** The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

**Note 4:** Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
