

# 440GR

## PowerPC 440GR Embedded Processor

*Preliminary Data Sheet*

### Features

- PowerPC® 440 processor core operating up to 667MHz with 32KB I-cache and D-cache with parity checking.
- Selectable processor:bus clock ratios of N:1, N:2.
- Dual bridged Processor Local Buses (PLBs) with 64- and 128-bit widths.
- Double Data Rate (DDR) Synchronous DRAM (SDRAM) interface operating up to 133MHz with ECC.
- DMA support for external peripherals, internal UART and memory.
- PCI V2.2 interface (3.3V only). Thirty-two bits at up to 66MHz.
- Programmable interrupt controller supports interrupts from a variety of sources.
- Programmable General Purpose Timers (GPT).
- Two Ethernet 10/100Mbps half- or full-duplex interfaces. Operational modes supported are MII, RMII, and SMII with packet reject.
- Up to four serial ports (16550 compatible UART).
- External peripheral bus (16-bit data) for up to six devices with external mastering.
- Two IIC interfaces (one with boot parameter read capability).
- NAND Flash interface.
- SPI interface.
- General Purpose I/O (GPIO) interface.
- JTAG interface for board level testing.
- Boot from PCI memory, NOR Flash on the external peripheral bus, or NAND Flash on the NAND Flash interface.
- Available in RoHS compliant lead-free package.

### Description

Designed specifically to address high-end embedded applications, the PowerPC 440GR (PPC440GR) provides a high-performance, low- power solution that interfaces to a wide range of peripherals and incorporates on-chip power management features.

This chip contains a high-performance RISC processor, DDR SDRAM controller, PCI bus interface, control for external ROM and peripherals, DMA with scatter-gather support, Ethernet ports, serial ports, IIC interfaces, SPI interface, NAND Flash interface, and general purpose I/O.

Technology: CMOS Cu-11, 0.13µm.

Package: 35mm, 456-ball enhanced plastic ball grid array (E-PBGA).

Typical power (estimated): Less than 2.5W at 533MHz, 2.3W at 400MHz.

Supply voltages required: 3.3V, 2.5V, 1.5V.

### Ordering and PVR Information

For information on the availability of the following parts, contact your local AMCC sales office.

Product Name	Order Part Number (see Notes:)	Package	Revision Level	PVR Value	JTAG ID
PPC440GR	PPC440GR-3pbfffCx	35mm, 456 ball, E-PBGA	B	0x422218D4	0x2A950049

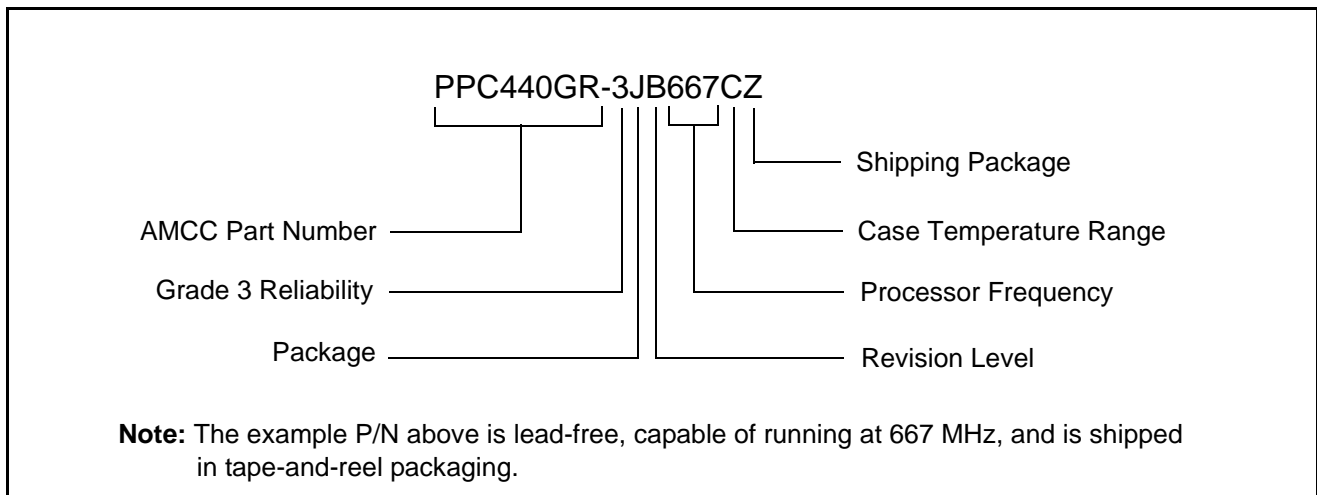

**Notes:**

1. p = Module Package type  
 B = E-PBGA and contains lead.  
 J = E-PBGA and is lead-free (RoHS compliant).
2. b = Chip revision level  
 B = Revision level B (1.1)
3. fff = Processor frequency  
 333 = 333MHz  
 400 = 400MHz  
 533 = 533MHz  
 667 = 667MHz
4. C = Case temperature range:  
 -40°C to +90°C for 333MHz and 400MHz parts  
 -40°C to +100°C for 533MHz parts  
 -40°C to 90°C for 333MHz and 400MHz parts  
 -40°C to +85°C for 667MHz parts
5. x = Shipping package type  
 Z = tape-and-reel  
 Blank = tray

Each part number contains a revision code. This is the die mask revision number and is included in the part number for identification purposes only.

The PVR (Processor Version Register) and the JTAG ID register are software accessible (read-only). Refer to the *PPC440GR User's Manual* for details on accessing these registers.

**Block Diagram**

Figure 2. PPC440GR Functional Block Diagram

The PPC440GR is a system on a chip (SOC) using IBM CoreConnect Bus™ Architecture.

## Address Maps

The PPC440GR incorporates two address maps. The first is a fixed processor System Memory Address Map. This address map defines the possible contents of various address regions which the processor can access. The second is the DCR Address Map for Device Configuration Registers (DCRs). The DCRs are accessed by software running on the PPC440GR processor through the use of `mtdcr` and `mfdcr` instructions.

**Notes:**

1. DCR address space is addressable with up to 10 bits (1024 or 1K unique addresses). Each unique address represents a single 32-bit (word) register. One kiloword (1024W) equals 4KB (4096 B).

**Preliminary Data Sheet****PowerPC 440 Processor Core**

The PowerPC 440 processor core is designed for high-end applications: RAID controllers, SAN, iSCSI, routers, switches, printers, set-top boxes, etc. It implements the Book E PowerPC embedded architecture and uses the 128-bit version of IBM's on-chip CoreConnect Bus Architecture.

Features include:

- Up to 667MHz operation
- PowerPC Book E architecture
- 32KB I-cache, 32KB D-cache
  - UTLB Word Wide parity on data and tag address parity with exception force
- Three logical regions in D-cache: locked, transient, normal
- D-cache full line flush capability
- 41-bit virtual address, 36-bit (64GB) physical address
- Superscalar, out-of-order execution
- 7-stage pipeline
- 3 execution pipelines
- Dynamic branch prediction
- Memory management unit
  - 64-entry, full associative, unified TLB with optional parity
  - Separate instruction and data micro-TLBs
  - Storage attributes for write-through, cache-inhibited, guarded, and big or little endian
- Debug facilities
  - Multiple instruction and data range breakpoints
  - Data value compare
  - Single step, branch, and trap events
  - Non-invasive real-time trace interface
- 24 DSP instructions
  - Single cycle multiply and multiply-accumulate
  - 32 x 32 integer multiply
  - 16 x 16 -> 32-bit MAC

## Internal Buses

The PowerPC 440GR features four standard on-chip buses: two Processor Local Buses (PLBs), one On-Chip Peripheral Bus (OPB), and the Device Control Register Bus (DCR). The high performance, high bandwidth cores such as the PowerPC 440 processor core, the DDR SDRAM memory controller, and the PCI bridge connect to the PLBs. The primary OPB hosts lower data rate peripherals. The daisy-chained DCR provides a lower bandwidth path for passing status and control information between the processor core and the other on-chip cores.

Features include:

- PLB 128 (PLB4)
  - 128-bit implementation of the PLB architecture
  - Separate and simultaneous read and write data paths
  - 36-bit address
  - Simultaneous control, address, and data phases
  - Four levels of pipelining
  - Byte-enable capability supporting unaligned transfers
  - 32- and 64-byte burst transfers
  - 133MHz, maximum 4.25GB/s (simultaneous read and write)
  - Processor:bus clock ratios of N:1 and N:2
- PLB 64 (PLB3)
  - 64-bit implementation of the PLB architecture
  - 32-bit address
  - 133MHz (1:1 ratio with PLB 128), maximum 1.1 GB/s (no simultaneous read and write)
- OPB
  - 32-bit data path
  - 32-bit address
  - 66.66MHz
- DCR
  - 32-bit data path
  - 10-bit address

## PCI Interface

The PCI interface allows connection of PCI devices to the PowerPC processor and local memory. This interface is designed to Version 2.2 of the PCI Specification and supports 32-bit PCI devices.

Reference Specifications:

- PowerPC CoreConnect Bus (PLB) Specification Version 3.1
- PCI Specification Version 2.2
- PCI Bus Power Management Interface Specification Version 1.1

Features include:

- PCI 2.2
  - Frequency to 66MHz
  - 32-bit bus
- PCI Host Bus Bridge or an Adapter Device's PCI interface
- Internal PCI arbitration function, supporting up to six external devices, that can be disabled for use with an external arbiter
- Support for Message Signaled Interrupts
- Simple message passing capability
- Asynchronous to the PLB
- PCI Power Management 1.1
- PCI register set addressable both from on-chip processor and PCI device sides
- Ability to boot from PCI bus memory
- Error tracking/status
- Supports initiation of transfer to the following address spaces:
  - Single beat I/O reads and writes
  - Single beat and burst memory reads and writes
  - Single beat configuration reads and writes (type 0 and type 1)
  - Single beat special cycles

## DDR SDRAM Memory Controller

The Double Data Rate (DDR) SDRAM memory controller supports industry standard discrete devices. Up to four 256MB logical banks are supported in limited configurations. Global memory timings, address and bank sizes, and memory addressing modes are programmable.

Features include:

- Registered and non-registered industry standard discrete devices
- 32-bit memory interface with optional 8-bit ECC (SEC/DED)
- Sustainable 1.1 GB/s peak bandwidth at 133MHz
- SSTL\_2 logic
- 1 to 4 chip selects
- CAS latencies of 2, 2.5 and 3 supported
- DDR200/266 support
- Page mode accesses (up to eight open pages) with configurable paging policy
- Programmable address mapping and timing
- Hardware and software initiated self-refresh
- Power management (self-refresh, suspend, sleep)

## External Peripheral Bus Controller (EBC)

Features include:

- Up to six ROM, EPROM, SRAM, Flash memory, and slave peripheral I/O banks supported
- Up to 66.66MHz operation
- Burst and non-burst devices
- 16-bit byte-addressable data bus
- 30-bit address
- Peripheral Device pacing with external “Ready”
- Latch data on Ready, synchronous or asynchronous
- Programmable access timing per device
  - 256 Wait States for non-burst
  - 32 Burst Wait States for first access and up to 8 Wait States for subsequent accesses
  - Programmable C<sub>son</sub>, C<sub>soff</sub> relative to address
  - Programmable OE<sub>on</sub>, WE<sub>on</sub>, WE<sub>off</sub> (1 to 4 clock cycles) relative to CS
- Programmable address mapping
- External DMA Slave Support
- External master interface
  - Write posting from external master
  - Read prefetching on PLB for external master reads
  - Bursting capable from external master
  - Allows external master access to all non-EBC PLB slaves
  - External master can control EBC slaves for own access and control

## Ethernet Controller Interface

Ethernet support provided by the PPC440GR interfaces to the physical layer but the PHY is not included on the chip:

- One to two 10/100 interfaces running in full- and half-duplex modes
  - One full Media Independent Interface (MII) with 4-bit parallel data transfer
  - Two Reduced Media Independent Interfaces (RMII) with 2-bit parallel data transfer
  - Two Serial Media Independent Interfaces (SMII)
  - Packet reject support

## DMA to PLB3 Controller

This DMA controller provides a DMA interface between the OPB and the 64-bit PLB.

Features include:

- Supports the following transfers:
  - Memory-to-memory transfers
  - Buffered peripheral to memory transfers
  - Buffered memory to peripheral transfers
- Four channels
- Scatter/Gather capability for programming multiple DMA operations
- 32-byte buffer
- 8-, 16-, 32-bit peripheral support (OPB and external)
- 32-bit addressing
- Address increment or decrement
- Supports internal and external peripherals
- Support for memory mapped peripherals
- Support for peripherals running on slower frequency buses

## DMA to PLB4 Controller

This DMA controller provides a DMA interface dedicated to the 128-bit PLB.

Features include:

- Support for memory-to-memory, peripheral-to-memory, and memory-to-peripheral transfers
- Scatter/gather capability
- 128-byte buffer with programmable thresholds

## Serial Ports (UART)

Features include:

- Up to four ports in the following combinations:
  - One 8-pin
  - Two 4-pin
  - One 4-pin and two 2-pin
  - Four 2-pin
- Selectable internal or external serial clock to allow wide range of baud rates
- Register compatibility with NS16550 register set
- Complete status reporting capability
- Fully programmable serial-interface characteristics
- Supports DMA using internal DMA function on PLB 64

## IIC Bus Interface

Features include:

- Two IIC interfaces provided
- Support for Philips® Semiconductors I<sup>2</sup>C Specification, dated 1995
- Operation at 100kHz or 400kHz
- 8-bit data
- 10- or 7-bit address
- Slave transmitter and receiver
- Master transmitter and receiver
- Multiple bus masters
- Two independent 4 x 1 byte data buffers
- Twelve memory-mapped, fully programmable configuration registers
- One programmable interrupt request signal
- Provides full management of all IIC bus protocols
- Programmable error recovery
- Includes an integrated boot-strap controller (BSC) that is multiplexed with the IIC0 interface

## Serial Peripheral Interface (SPI/SCP)

The Serial Peripheral Interface (also known as the Serial Communications Port) is a full-duplex, synchronous, character-oriented (byte) port that allows the exchange of data with other serial devices. The SCP is a master on the serial port supporting a 3-wire interface (receive, transmit, and clock), and is a slave on the OPB.

Features include:

- Three-wire serial port interface
- Full-duplex synchronous operation
- SCP bus master
- OPB bus slave
- Programmable clock rate divider
- Clock inversion
- Reverse data
- Local data loop back for test

## NAND Flash Controller

The NAND Flash controller provides a simple interface between the EBC and up to four separate external NAND Flash devices. It provides both direct command, address, and data access to the external device as well as a memory-mapped linear region that generates data accesses. NAND Flash device data appears on the peripheral data bus.

Features include:

- 1 to 4 banks supported on EBC
- Direct Interfacing to:
  - Discrete NAND Flash devices (up to 4 devices)
  - SmartMedia Card socket (22-pins)
- Device sizes
  - 4MB and larger supported for read/write access
  - 4MB to 256MB boot-from-NAND flash (size supported depends on addressing mode)
- (512 + 16)-B or (2K + 64)-B device page sizes supported
- Boot-from-NAND: Execute a linear sequence of boot code out of the first 4KB of block 0
- Support DMA to allow direct, no-processor-intervention block copy from NAND Flash to SDRAM
- ECC provides single-bit error correction and double-bit error detection in each 256B of stored data
- Chip selects shared with EBC

## General Purpose Timers (GPT)

Provides a separate time base counter and additional system timers in addition to those defined in the processor core.

Features include:

- 32-bit Time Base Counter driven by the OPB bus clock
- Seven 32-bit compare timers

## General Purpose IO (GPIO) Controller

- Controller functions and GPIO registers are programmed and accessed via memory-mapped OPB bus master accesses.
- 64 GPIOs are multiplexed with other functions. DCRs control whether a particular pin that has GPIO capabilities acts as a GPIO or is used for another purpose.
- Each GPIO output is separately programmable to emulate an open drain driver (that is, drives to zero, tri-stated if output bit is 1).

## Universal Interrupt Controller (UIC)

Two Universal Interrupt Controllers (UIC) are employed. They provide control, status, and communications necessary between the external and internal sources of interrupts and the on-chip PowerPC processor.

**Note:** Processor specific interrupts (for example, page faults) do not use UIC resources.

Features include:

- 10 external interrupts
- Edge triggered or level-sensitive
- Positive or negative active
- Non-critical or critical interrupt to the on-chip processor core
- Programmable interrupt priority ordering
- Programmable critical interrupt vector for faster vector processing

## JTAG

Features include:

- IEEE 1149.1 Test Access Port
- IBM RISCWatch Debugger support
- JTAG Boundary Scan Description Language (BSDL)

## Signal Lists

The following table lists all the external signals in alphabetical order and shows the ball (pin) number on which the signal appears. Multiplexed signals are shown with the default signal (following reset) *not* in brackets and alternate signals in brackets. Multiplexed signals appear alphabetically multiple times in the list—once for each signal name on the ball. The page number listed gives the page in “Signal Functional Description” on page 53 where the signals in the indicated interface group begin. In cases where signals in the same interface group (for example, Ethernet) have different names to distinguish variations in the mode of operation, the names are separated by a comma with the primary mode name appearing first. These signals are listed only once, and appear alphabetically by the primary mode name.

Table 5. Signals Listed Alphabetically (Sheet 1 of 24)

Signal Name	Ball	Interface Group	Page

In the following table, only the primary (default) signal name is shown for each pin. Multiplexed or multifunction signals are marked with an asterisk (\*). To determine what signals or functions are multiplexed on those pins, look up the primary signal name in Table 5, *Signals Listed Alphabetically*.

## Signal Descriptions

The PPC440GR embedded controller is packaged in a 456-ball enhanced plastic ball grid array (E-PBGA). The following tables describe the package level pinout.

Table 7. Pin Summary

Group	No. of Pins
Signal pins, non-multiplexed	221
Signal pins, multiplexed	62
<b>Total Signal Pins</b>	<b>283</b>
AV <sub>DD</sub>	1
SAV <sub>DD</sub>	1
SAGnd	1
AGnd	1
OV <sub>DD</sub>	18
SV <sub>DD</sub>	18
V <sub>DD</sub>	32
Gnd	80
<b>Total Power Pins</b>	<b>152</b>
Reserved	21
<b>Total Pins</b>	<b>456</b>

In the table “Signal Functional Description” on page 53, each I/O signal is listed along with a short description of its function. Active-low signals (for example, RAS) are marked with an overline. Please see “Signals Listed Alphabetically” on page 19 for the pin (ball) number to which each signal is assigned.

### Multiplexed Signals

Some signals are multiplexed on the same pin so that the pin can be used for different functions. In most cases, the signal names shown in this table are not accompanied by signal names that may be multiplexed on the same pin. If you need to know what, if any, signals are multiplexed with a particular signal, look up the name in “Signals Listed Alphabetically” on page 19. It is expected that in any single application a particular pin will always be programmed to serve the same function. The flexibility of multiplexing allows a single chip to offer a richer pin selection than would otherwise be possible. The circuit type for multiplexed signals is shown as “Multiplex.” The actual circuit type is the same as the primary signal.

**Note:** Signals multiplexed with GPIO default to GPIO receivers and float after reset. Initialization software must configure the GPIO registers for the desired function as described in the GPIO chapter of the User’s Manual. Any of these signals requiring a particular state prior to running initialization code must be terminated with pull ups or pull downs.

### Multipurpose Signals

In addition to multiplexing, some pins are also multi-purpose. For example, the EBC peripheral controller address pins (PerAddr) are used as outputs by the PPC440GR to broadcast an address to external slave devices when the PPC440GR has control of the external bus. When during the course of normal chip operation an external master gains ownership of the external bus, these same pins are used as inputs which are driven by the external master and received by the EBC in the PPC440GR. In this example, the pins are also bidirectional, serving both as inputs

and outputs.

### Multimode Signals

In some cases (for example, Ethernet) the function of a pin may vary with different modes of operation. When a pin has multiple signal names assigned to distinguish different modes of operation, all of the names are shown.

### Strapping Pins

One group of pins is used as strapped inputs during system reset. These pins function as strapped inputs only during reset and are used for other functions during normal operation (see “Strapping” on page 85). Note that these are *not multiplexed* pins since the function of the pins is not programmable.

### Reserved Pins

The balls marked *Reserved* on this chip are not functional. However, most of the reserved balls cannot be left unconnected. Connect the balls shown in Table 8 as indicated:

Table 8. Non-Functional Ball Connections

Ball	Connection
R23	GND
R24	GND
U23	GND
V23	GND
W25	GND
W26	GND
Y26	GND
AB23	GND
AB24	GND

AC21	GND
AC24	GND
AD20	GND
AD21	GND
AD22	GND
AD23	GND
AE22	do not connect
AE23	GND
AE26	GND
AF23	do not connect
AF24	GND

## Unused I/Os

Termination of unused receivers is generally required; however there are some exceptions that reduce or eliminate the need for termination.

### *Signals Multiplexed with GPIO:*

By Default after reset, signals shared with GPIO pins are configured as GPIO receivers. Termination however is not needed if the GPIO during initialization are configured as outputs. To configure as drivers, set and clear the appropriate bits in the GPIOx\_ODR, GPIOx\_TCR and GPIOx\_OR registers as described in the GPIO chapter of the user's manual.

### *PCI:*

When the PCI bridge is unused, configure the PCI controller to park on the bus by pulling the PCIReq0 [Gnt] signal low. Parking forces the PLB3 to PCI bridge to actively drive PCIAD31:0 and PCIC3:0[BE3:0]. The remaining PCI control signals must be terminated as follows:

- Disable the internal PCI arbiter and enable PCI synchronous mode (See IIC Boot Strap Chapter in the user's manual).  
(**Note:** Synchronous mode is not supported when operating the PCI bus. This mode should only be used for terminating an unused PCI interface).
- Individually connect PCISerr, PCIPerr, PCITRDY, and PCISstop through 3kΩ resistors to +3.3v.
- Terminate PCIReq1:5 through 3kΩ resistors to +3.3v.
- Terminate PCIReq0[Gnt] through a 1kΩ resistor to GND.

### *DDR:*

When ECC is not used, no termination is needed for unused ECC signals (ECC0:7, DM8, and DS8).

### *USB Host:*

When the USB Host interface is not used, a clock is still required for USB1Clk in order to reset the USB Host. If the USB Host does not reset, it can interfere with the internal PLB3 and OPB buses. The USB Host signals must be terminated as follows:

- A clock must be connected to USB1Clk. The clock can be any frequency from 32kHz to 48MHz.
- USB1HostXcvr and USB1HostXcv signals must be pulled down.

### *USB Device:*

The USB Device requires a subset of the USB signals to be terminated.

- USB2LS0[DrvrInh1][RejectPkt] must be pulled up unless used as a packet reject input.
- USB2D10:7, USB1DevXcvr, USB1DevXcvr and USB2Clk signals must be pulled down.

### *SMII0, RMIIO or MII:*

- Configure EMAC0 to use internal clocks by setting SDR0\_MFR[E0CS]=1 and reset EMAC0 by setting EMAC0\_MR0[SRST]=1.
- No pull ups or pull downs required

### *SMII1, RMII1 or MII:*

- Configure EMAC1 to use internal clocks by setting SDR0\_MFR[E1CS]=1 and reset EMAC1 by setting EMAC0\_MR1[SRST]=1.
- No pull ups or downs required.

### *Oddities:*

TmrClk2 must be connected to a clock to ensure reset of internal logic. It can be connected to any available clocks in the frequency range of 32kHz to 100MHz.

Table 9. Signal Functional Description (Sheet 1 of 8)

**Notes:**

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k $\Omega$  to 3.3V)
3. Must pull down (recommended value is 1k $\Omega$ )
4. If not used, must pull up (recommended value is 3k $\Omega$  to 3.3V)
5. If not used, must pull down (recommended value is 1k $\Omega$ )
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
<b>PCI Interface</b>				
PCIAD00:31	Address/Data bus (bidirectional).	I/O	3.3V PCI	
PCIC0:3/BE0:3	PCI Command/Byte Enables.	I/O	3.3V PCI	
PCIClk	Provides timing to the PCI interface for PCI transactions.	I	3.3V PCI	5
$\overline{\text{PCIDevSel}}$	Indicates the driving device has decoded its address as the target of the current access. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI	
$\overline{\text{PCIFrame}}$	Driven by the current master to indicate beginning and duration of an access. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI	
$\overline{\text{PCIGnt1/Req}}$	Indicates that the specified agent is granted access to the bus. When the internal arbiter is enabled, output is $\overline{\text{PCIGnt0}}$ . When the internal arbiter is disabled, output is $\overline{\text{Req}}$ .	O	3.3V PCI	
$\overline{\text{PCIGnt2:6}}$	Indicates that the specified agent is granted access to the bus.	O	3.3V PCI	
PCIIDSel	Used as a chip select during configuration read and write transactions.	I	3.3V PCI	
$\overline{\text{PCIINT}}$	Level sensitive PCI interrupt.	O	3.3V PCI	
$\overline{\text{PCIIRDY}}$	Indicates initiating agent's ability to complete the current data phase of the transaction. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI	
PCIPar	Even parity.	I/O	3.3V PCI	
$\overline{\text{PCIPErr}}$	Reports data parity errors during all PCI transactions except a Special Cycle. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI	
$\overline{\text{PCIReq0/Gnt}}$	Indicates to the PCI arbiter that the specified agent wishes to use the bus. When the internal arbiter is enabled, input is $\overline{\text{PCIReq0}}$ . When internal arbiter is disabled, input is $\overline{\text{Gnt}}$ .	I	3.3V PCI	4
$\overline{\text{PCIReq1:5}}$	An indication to the PCI arbiter that the specified agent wishes to use the bus.	I	3.3V PCI	4
$\overline{\text{PCIReset}}$	Brings PCI device registers and logic to a consistent state.	O	3.3V PCI	
$\overline{\text{PCISErr}}$	Reports address parity errors, data parity errors on the Special Cycle command, or other catastrophic system errors. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI	
$\overline{\text{PCIStop}}$	Indicates the current target is requesting the master to stop the current transaction. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI	
$\overline{\text{PCITRDY}}$	Indicates the target agent's ability to complete the current data phase of the transaction. (PCI 2.2 specification requires 8.2k $\Omega$ pull up on host system)	I/O	3.3V PCI

Reserved	To avoid noise pickup problems, most of these balls must be connected in the board design as shown Table 8 on page 51.	na	na	

## Device Characteristics

Table 10. Absolute Maximum Ratings

The absolute maximum ratings below are stress ratings only. Operation at or beyond these maximum ratings can cause permanent damage to the device. None of the performance specification contained in this document are guaranteed when operating at these maximum ratings.

Characteristic	Symbol	Value	Unit	Notes
Supply Voltage (Internal Logic)	$V_{DD}$	0 to +1.65	V	1
Supply Voltage (I/O, except SDRAM, Ethernet)	$OV_{DD}$	0 to +3.6	V	1
Supply Voltage (SDRAM, Ethernet)	$SV_{DD}$	0 to +2.7	V	
PLL Supply Voltage	$AV_{DD}$	0 to +1.65	V	2
SDRAM PLL Supply Voltage	$SAV_{DD}$	0 to +1.65	V	2
Input Voltage (3.3V LVTTTL receivers)	$V_{IN}$	0 to +3.6	V	
Storage Temperature Range	$T_{STG}$	-55 to +150	°C	
Case temperature under bias	$T_C$	-40 to +120	°C	2

**Notes:**

1. If  $OV_{DD} \leq 0.4V$ , it is required that  $V_{DD} \leq 0.4V$ . Supply excursions not meeting this criteria must be limited to less than 25ms duration during each power up or power down event.
2. This value is not a specification of the operational temperature range, it is a stress rating only.

**Preliminary Data Sheet**

Table 11. Recommended DC Operating Conditions (Sheet 1 of 2)

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Logic Supply Voltage	$V_{DD}$	+1.4	+1.5	+1.6	V	4
I/O Supply Voltage	$OV_{DD}$	+3.0	+3.3	+3.6	V	4
SDRAM Supply Voltage	$SV_{DD}$	+2.3	+2.5	+2.7	V	4
PLL Supply Voltages	$AV_{DD}$	+1.4	+1.5	+1.6	V	3, 4
SDRAM PLL Voltage	$SAV_{DD}$	+1.4	+1.5	+1.6	V	3, 4
DDR SDRAM Reference Voltage	$SV_{REF}$	+1.15	+1.25	+1.35	V	2
Input Logic High (2.5V SSTL)	$V_{IH}$	$SV_{REF}+0.18$		$SV_{DD}+0.3$	V	
Input Logic High (2.5V CMOS, 3.3V tolerant receiver)		1.7		???	V	
Input Logic High (3.3V PCI)		$0.5OV_{DD}$		$OV_{DD}+0.5$	V	1
Input Logic High (3.3V LVTTTL)		+2.0		+3.6	V	
Input Logic Low (2.5V SSTL)	$V_{IL}$	-0.3		$SV_{REF}-0.18$	V	
Input Logic Low (2.5V CMOS, 3.3V tolerant receiver)				0.7	V	
Input Logic Low (3.3V PCI)		-0.5		$0.35OV_{DD}$	V	1
Input Logic Low (3.3V LVTTTL)		0		+0.8	V	
Output Logic High (2.5V SSTL)	$V_{OH}$	+1.95		$SV_{DD}$	V	
Output Logic High (2.5V CMOS, 3.3V tolerant receiver)		2.0			V	
Output Logic High (3.3V PCI)		$0.9OV_{DD}$		$OV_{DD}$	V	1
Output Logic High (3.3V LVTTTL)		+2.4		$OV_{DD}$	V	
Output Logic Low (2.5V SSTL)	$V_{OL}$	0		0.55	V	
Output Logic Low (2.5V CMOS, 3.3V tolerant receiver)				0.4	V	
Output Logic Low (3.3V PCI)				$0.1OV_{DD}$	V	1
Output Logic Low (3.3V LVTTTL)		0		+0.4	V	
Input Leakage Current (No pull-up or pull-down)	$I_{IL1}$	0		0	$\mu A$	
Input Leakage Current for Pull-Down	$I_{IL2}$	0 (LPDL)		200 (MPUL)	$\mu A$	
Input Leakage Current for Pull-Up	$I_{IL3}$	-150 (LPDL)		0 (MPUL)	$\mu A$	
Input Max Allowable Overshoot (3.3V LVTTTL)	$V_{IMAO}$			+3.9	V	4, 5
Input Max Allowable Undershoot (3.3V LVTTTL)	$V_{IMAU}$	-0.6			V	4, 5
Output Max Allowable Overshoot (3.3V LVTTTL)	$V_{OMAO}$			+3.9	V	4, 5
Output Max Allowable Undershoot (3.3V LVTTTL)	$V_{OMAU3}$	-0.6			V	4, 5

Table 11. Recommended DC Operating Conditions (Sheet 2 of 2)

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Case Temperature: 333MHz and 400MHz parts in any package 533MHz parts in any package 667MHz parts	$T_C$	-40 -40 -40		-90 -100 +85	$^{\circ}C$	

**Notes:**

1. PCI drivers meet PCI specifications.
2.  $SV_{REF} = SV_{DD}/2$
3. The analog voltages used for the on-chip PLLs can be derived from the logic voltage, but must be filtered before entering the PPC440GR. See "Absolute Maximum Ratings" on page 61.
4. Overshoot and undershoot voltages are for 10% duty cycle.
5. The time for overshoot or undershoot is time above  $OV_{DD}$  and the time below  $0V$ .

Figure 4. Overshoot Waveform

Table 12. Overshoot and Undershoot

Receiver	AC Overshoot (V)	DC Overshoot (V)	DC Undershoot (V)	AC Undershoot (V)	T <sub>Os</sub>
3.3V LVTTTL	3.9	3.6	0	-0.6	0.1*T <sub>CYC</sub> <sup>1</sup>
2.5V (3.3V tolerant)	3.9	3.6	0	-0.6	0.1*T <sub>CYC</sub> <sup>1</sup>
DDR	1.2*SOV <sub>DD</sub>	SOV <sub>DD</sub> + 0.3	0	-0.6	0.1/MemClkOut
PCI	1.2*OV <sub>DD</sub>	OV <sub>DD</sub> + 0.5	0	-0.2*OV <sub>DD</sub>	0.1/PCIClk

**Notes:**

- T<sub>CYC</sub> is the period of the bus clock.  
1/PerClk - EBC and NAND flash interfaces.  
1/EMCRXCik - MII mode  
1/EMCRefclk - RMI mode  
1/SMIIRefClk - SMII mode  
1/USB2Cik - UTMI  
1/TrcClk - instruction trace interface  
1/IIC0Clk and 1/IIC1Clk - IIC interfaces  
1/SPIClkOut - SPI

## Power Sequencing

Startup sequencing of the power supply voltages is not required. However, a power-down cycle must complete (OV<sub>DD</sub> and V<sub>DD</sub> are below +0.4V) before a new power-up cycle is started.

## Analog Voltage Filter

The analog voltages used for the on-chip PLLs can be derived from the logic voltage, but must be filtered before entering the PPC440GR. A separate filter, as shown below, is recommended for each voltage.

- The filter should keep the AV<sub>DD</sub>-AGND (SAGND-SAGND) compression/expansion due to noise less than  $\pm 50$  mV.
- All wire lengths of the filter circuit should be kept as short as possible to minimize coupling from other signals.
- AGND (SAGND) must be connected to the digital ground plane at the AV<sub>DD</sub> (SAV<sub>DD</sub>) capacitor.
- The impedance of the ferrite bead should be much greater than that of the capacitor at frequencies where noise is expected.

L – SMT ferrite bead chip, Murata BLM21PG600SN1

C – 0.1  $\mu$ F ceramic

Table 13. Input Capacitance

Parameter	Symbol	Maximum	Unit	Notes
Group 1 (2.5V SSTL I/O)	$C_{IN1}$	2.5	pF	
Group 2 (3.3V LVTTTL I/O)	$C_{IN2}$	2.1	pF	
Group 3 (PCI I/O)	$C_{IN3}$	2.5	pF	
Group 4 (Receivers)	$C_{IN4}$	0.9	pF	
Group 5 (3.3V tolerant CMOS I/O)	$C_{IN5}$	2.4	pF	
Group 6 (USB)	$C_{IN6}$	4.5	pF	

Table 14. Typical DC Power Supply Requirements

Frequency (MHz)	+1.5V Supply ( $V_{DD}+AV_{DD}+SAV_{DD}$ )	+2.5V Supply ( $SV_{DD}$ )	+3.3V Supply ( $OV_{DD}$ )	Total	Unit	Notes
333	1.00	1.15	0.04	2.19	W	1
400	1.09	1.15	0.04	2.28	W	1
533	1.28	1.15	0.04	2.47	W	1
667	1.93	1.15	0.04	3.12	W	1

**Notes:**

1. Typical Power is based on nominal voltage of  $V_{DD} = +1.5V$ ,  $T_C = \text{max.}$  specified in Table 11 on page 62, while running Linux and a test application that exercises each core with representative traffic.

Table 15.  $V_{DD}$  Supply Power Dissipation

Frequency (MHz)	+1.4V	+1.5V	+1.6V	Unit	Notes
333	0.83	1.00	1.24	W	1
400	0.91	1.09	1.35	W	1
533	1.09	1.28	1.57	W	1
667	1.62	1.93	2.38	W	1

**Notes:**

1. Power is based on  $V_{DD}$  specified in the table and  $T_C = \text{max.}$  specified in Table 11 on page 62, while running Linux and a test application that exercises each core with representative traffic.

**Preliminary Data Sheet**

Table 16. DC Power Supply Loads

Parameter	Symbol	Typical	Maximum	Unit	Notes
V <sub>DD</sub> (1.5V) active operating current	I <sub>DD</sub>	1250	1900	mA	
OV <sub>DD</sub> (3.3V) active operating current	I <sub>ODD</sub>	10	100	mA	
SV <sub>DD</sub> (2.5V) active operating current	I <sub>SDD</sub>	460	600	mA	
AV <sub>DD</sub> (1.5V) input current	I <sub>ADD</sub>	3.2	5	mA	1
SAV <sub>DD</sub> (1.5V) active operating current	I <sub>SADD</sub>	6.05	10	mA	1

**Notes:**

- See “Absolute Maximum Ratings” on page 61 for filter recommendations.
- The maximum current values listed above are not guaranteed to be the highest obtainable. These values are dependent on many factors including the type of applications running, clock rates, use of internal functional capabilities, external interface usage, case temperature, and the power supply voltages. Your specific application can produce significantly different results. V<sub>DD</sub> current and power are primarily dependent on the applications running and the use of internal chip functions (DMA, PCI, Ethernet, and so on). OV<sub>DD</sub> current and power are primarily dependent on the capacitive loading, frequency, and utilization of the external buses.
- Typical current is estimated at 667MHz with V<sub>DD</sub> = +1.5V, OV<sub>DD</sub> = +3.3V, SV<sub>DD</sub> = +2.5V, and T<sub>C</sub> = +85°C, while running Linux and a test application that exercises each core with representative traffic.
- Maximum current is estimated at 667MHz with V<sub>DD</sub> = +1.6V, OV<sub>DD</sub> = +3.6V, SV<sub>DD</sub> = +2.7V, and T<sub>C</sub> = +85°C, and best-case process (which drives worst-case power), while running Linux and a test application that exercises each core with representative traffic.

**Test Conditions**

Clock timing and switching characteristics are specified in accordance with operating conditions shown in the table “Recommended DC Operating Conditions.” AC specifications are characterized with V<sub>DD</sub> = 1.5V, T<sub>C</sub> = +85 °C and a 50pF test load as shown in the figure to the right.

Table 17. Package Thermal Specifications

Thermal resistance values for the E-PBGA package are as follows:

Parameter	Symbol	Package	Airflow ft/min (m/sec)			Unit	Notes
			0 (0)	100 (0.51)	200 (1.02)		
Junction-to-ambient thermal resistance without heat sink	$\theta_{JA}$	E-PBGA	20.0	18.7	17.9	°C/W	
		TE-PBGA	15.6	13.6	12.8	°C/W	
Junction-to-ambient thermal resistance with heat sink	$\theta_{JA}$	E-PBGA	15.3	11.9	10.5	°C/W	
		TE-PBGA	13.9	10.4	9.0	°C/W	
			<b>Resistance Value</b>				
Junction-to-case thermal resistance	$\theta_{JC}$	E-PBGA	8.3			°C/W	
		TE-PBGA	6.3			°C/W	
Junction-to-board thermal resistance	$\theta_{JB}$	E-PBGA	14.3			°C/W	
		TE-PBGA	9.3			°C/W	

*Table 17. Package Thermal Specifications*

Thermal resistance values for the E-PBGA package are as follows:

Parameter	Symbol	Package	Airflow ft/min (m/sec)			Unit	Notes
			0 (0)	100 (0.51)	200 (1.02)		

**Notes:**

1. Case temperature,  $T_C$ , is measured at top center of case surface with device soldered to circuit board.
2.  $T_A = T_C - P \times \theta_{CA}$ , where  $T_A$  is ambient temperature and P is power consumption.
3.  $T_{CMax} = T_{JMax} - P \times \theta_{JC}$ , where  $T_{JMax}$  is maximum junction temperature (+125°C) and P is power consumption.
4. The preceding equations assume that the chip is mounted on a board with at least one signal and two power planes.
5. Values in the table were achieved with a JEDEC standard board: 114.5mm x 101.6mm x 1.6mm, 4 layers.
6. Values for an attached heat sink were achieved with a 35mm x 35mm x 15mm unit (see Thermal Management below), attached with a 0.1mm thickness of adhesive having a thermal conductivity of 1.3 W/mK.

**Thermal Management**

The following heat sinks were used in the above thermal analysis:

ALPHA W35-15W (35mm x 35mm x15mm)

ALPHA LPD35-15B (35mm x 35mm x15mm)

The heat sinks are manufactured by:

Alpha Novatech, Inc. ([www.alphanovatech.com](http://www.alphanovatech.com))

473 Sapena Court, #12

Santa Clara, CA 95054

Phone: 408-567-8082

**Preliminary Data Sheet**

Table 18. Clocking Specifications

Symbol	Parameter	Min	Max	Units
<b>CPU Clock</b>				
$F_C$	Frequency	333	667	
<b>SysClk Input</b>				
$F_C$	Frequency	33.33	66.66	MHz
$T_C$	Period	15	30	ns

$T_C$	Period	12	22.2	ns

Figure 5. Timing Waveform

**Note:** SysClk is 2.5V/3.3V tolerant receiver. Slew rate should be measured between 0.7V and 1.7V.

## Spread Spectrum Clocking

Care must be taken when using a spread spectrum clock generator (SSCG) with the PPC440GR. This controller uses a PLL for clock generation inside the chip. The accuracy with which the PLL follows the SSCG is referred to as tracking skew. The PLL bandwidth and phase angle determine how much tracking skew there is between the SSCG and the PLL for a given frequency deviation and modulation frequency. When using an SSCG with the PPC440GR the following conditions must be met:

- The frequency deviation must not violate the minimum clock cycle time. Therefore, when operating the PPC440GR with one or more internal clocks at their maximum supported frequency, the SSCG can only lower the frequency.
- The maximum frequency deviation cannot exceed –3%, and the modulation frequency cannot exceed 40kHz. In some cases, on-board PPC440GR peripherals impose more stringent requirements.
- Use the Peripheral Bus Clock for logic that is synchronous to the peripheral bus since this clock tracks the modulation.
- Use the DDR SDRAM MemClkOut since it also tracks the modulation.

### Notes:

1. The serial port baud rates are synchronous to the modulated clock. The serial port has a tolerance of approximately 1.5% on baud rate before framing errors begin to occur. The 1.5% tolerance assumes that the connected device is running at precise baud rates.
2. Ethernet operation is unaffected.
3. IIC operation is unaffected.

**Important:** It is up to the system designer to ensure that any SSCG used with the PPC440GR meets the above requirements and does not adversely affect other aspects of the system.

**Preliminary Data Sheet****I/O Specifications**

Table 19. Peripheral Interface Clock Timings

Parameter	Min	Max	Units	Notes
PCIClk input frequency (asynchronous mode)	–	66.66	MHz	
PCIClk period (asynchronous mode)	15	–	ns	
PCIClk input high time	40% of nominal period	60% of nominal period	ns	
PCIClk input low time	40% of nominal period	60% of nominal period	ns	
EMCMDClk output frequency	–	2.5	MHz	
EMCMDClk period	400	–	ns	
EMCMDClk output high time	160	–	ns	
EMCMDClk output low time	160	–	ns	
EMCTxCIk input frequency MII	2.5	25	MHz	
EMCTxCIk period MII	40	400	ns	
EMCTxCIk input high time	35% of nominal period	–	ns	
EMCTxCIk input low time	35% of nominal period	–	ns	
EMCRxCIk input frequency MII	2.5	25	MHz	
EMCRxCIk period MII	40	400	ns	
EMCRefClk input frequency RMII (SMII)	50 (125)	50 (125)	MHz	2
EMCRefClk period RMII (SMII)	20 (8)	20 (8)	ns	
EMCRefClk input high time	35% of nominal period	65% of nominal period	ns	
EMCRefClk input low time	35% of nominal period	65% of nominal period	ns	

Table 19. Peripheral Interface Clock Timings (Continued)

Parameter	Min	Max	Units	Notes
EMCRxCk input high time	35% of nominal period	–	ns	
EMCRxCk input low time	35% of nominal period	–	ns	
PerClk (and OPB Clock) output frequency (for ext. master or sync. slaves)	33.33	66.66	MHz	
PerClk period	15	30	ns	
PerClk output high time	50% of nominal period	66% of nominal period	ns	
PerClk output low time	33% of nominal period	50% of nominal period	ns	
UARTSerClk input frequency	–	$1000 / (2T_{OPB} + 2ns)$	MHz	1
UARTSerClk period	$2T_{OPB} + 2$	–	ns	1
UARTSerClk input high time	$T_{OPB} + 1$	–	ns	1
UARTSerClk input low time	$T_{OPB} + 1$	–	ns	1
TmrClk1 input frequency	–	100	MHz	2
TmrClk1 period	10	–	ns	
TmrClk1 input high time	40% of nominal period	60% of nominal period	ns	
TmrClk1 input low time	40% of nominal period	60% of nominal period	ns	

**Notes:**

1.  $T_{OPB}$  is the period in ns of the OPB clock. The internal OPB clock runs at 1/2 the frequency of the PLB clock. The maximum OPB clock frequency is 66.66 MHz.
2. In RMI mode, 50MHz +/- 50PPM input EMCCRefClk is required. In SMII mode, a 125 MHz +/- 100PPM input EMCCRefClk is required.

Figure 6. Input Setup and Hold Waveform

Figure 7. Output Delay and Float Timing Waveform

Table 20. I/O Specifications—PCI, UART, IIC, SPI, Ethernet, System and Debug Interfaces (Sheet 1 of 2)

**Notes:**

1. Ethernet interface meets timing requirements as defined by IEEE 802.3 standard.
2. EMCSync is a weak driver. Redrive EMCSync when driving more than one load.

## DDR SDRAM I/O Specifications

The DDR SDRAM controller times its operation with internal PLB clock signals and generates MemClkOut0 from the PLB clock. The PLB clock is an internal signal that cannot be directly observed. However MemClkOut0 is the same frequency as the PLB clock signal and is in phase with the PLB clock signal.

**Note:** MemClkOut0 can be advanced with respect to the PLB clock by means of the SDRAM0\_CLKTR programming register. In a typical system, users advance MemClkOut by 90°. This depends on the specific application and requires a thorough understanding of the memory system in general (refer to the DDR SDRAM controller chapter in the *PowerPC 440GR User's Manual*).

In the following sections, the label MemClkOut0(0) refers to MemClkOut0 when it has not been phase-shifted, and MemClkOut0(90) refers to MemClkOut0 when it has been phase-advanced 90°. Advancing MemClkOut0 by 90° creates a 3/4 cycle setup time and 1/4 cycle hold time for the address and control signals in relation to MemClkOut0(90). The rising edge of MemClkOut0(90) aligns with the first rising edge of the DQS signal.

The following DDR data is generated by means of simulation and includes logic, driver, package RLC, and lengths. Values are calculated over best case and worst case processes with speed, temperature, and voltage as follows:

Best Case = Fast process, -40°C, +1.6V

Worst Case = Slow process, +85°C, +1.4V

**Note:** In all the following DDR tables and timing diagrams, *minimum* values are measured under *best* case conditions and *maximum* values are measured under *worst* case conditions.

The signals are terminated as indicated in the figure below for the DDR timing data in the following sections.

Figure 8. DDR SDRAM Simulation Signal Termination Model

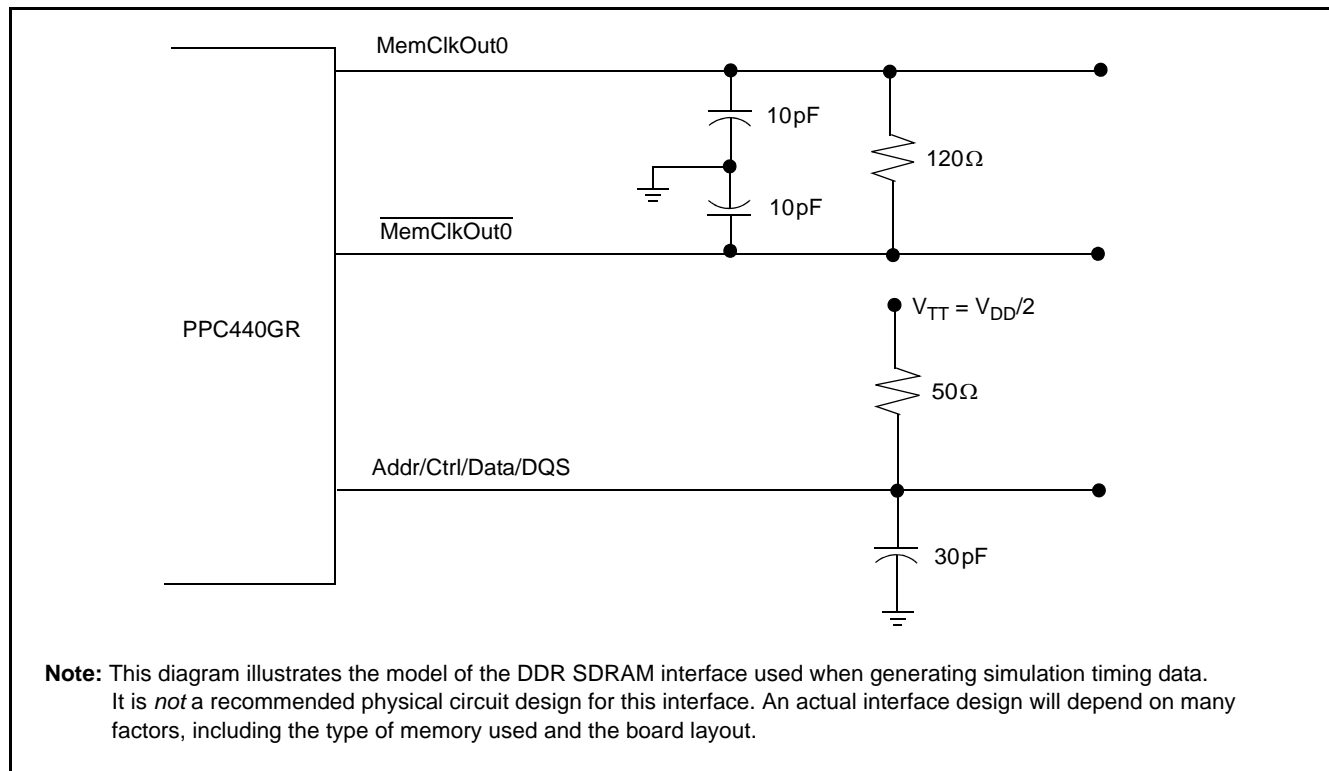

Table 22. DDR SDRAM Output Driver Specifications

Signal Path	Output Current (mA)	
	I/O H (maximum)	I/O L (minimum)
<b>Write Data</b>

DQS0:8	15.2	15.2

Table 23. I/O Timing—DDR SDRAM  $T_{DS}$ **Notes:**

- All of the DQS signals are referenced to MemClkOut0(0).
- Clock speed is 133MHz.
- The  $T_{DS}$  values in the table include 3/4 of a cycle at 133MHz ( $7.5\text{ns} \times 0.75 = 5.625\text{ ns}$ ).
- To obtain adjusted values for lower clock frequencies, subtract 5.625 ns from the values in the table and add 3/4 of the cycle time for the lower clock frequency ( $T_{DS} - 5.625 + 0.75T_{CYC}$ ).

Signal Name	$T_{DS}$ (ns)	
	Minimum	Maximum
DQS0	5.76	5.86
DQS1	5.78	5.91
DQS2	5.82	5.90
DQS3	5.79	5.89
DQS8	5.75	5.88

Table 24. I/O Timing—DDR SDRAM  $T_{SK}$ ,  $T_{SA}$ , and  $T_{HA}$ **Notes:**

- Clock speed is 133MHz.  $T_{SK}$  is referenced to MemClkOut0(0).  $T_{SA}$  and  $T_{HA}$  are referenced to MemClkOut0(90).
- To obtain adjusted  $T_{SA}$  values for lower clock frequencies, use 3/4 of the cycle time for the lower clock frequency and subtract  $T_{SK}$  maximum ( $0.75T_{CYC} - T_{SKmax}$ ).
- To obtain adjusted  $T_{HA}$  values for lower clock frequencies, use 1/4 of the cycle time for the lower clock frequency and add  $T_{SK}$  minimum ( $0.25T_{CYC} + T_{SKmin}$ ).

Signal Name	$T_{SK}$ (ns)		$T_{SA}$ (ns)	$T_{HA}$ (ns)
	Minimum	Maximum	Minimum	Minimum
MemAddr00:12	0.11	0.32	5.31	1.99

## DDR SDRAM Read Operation

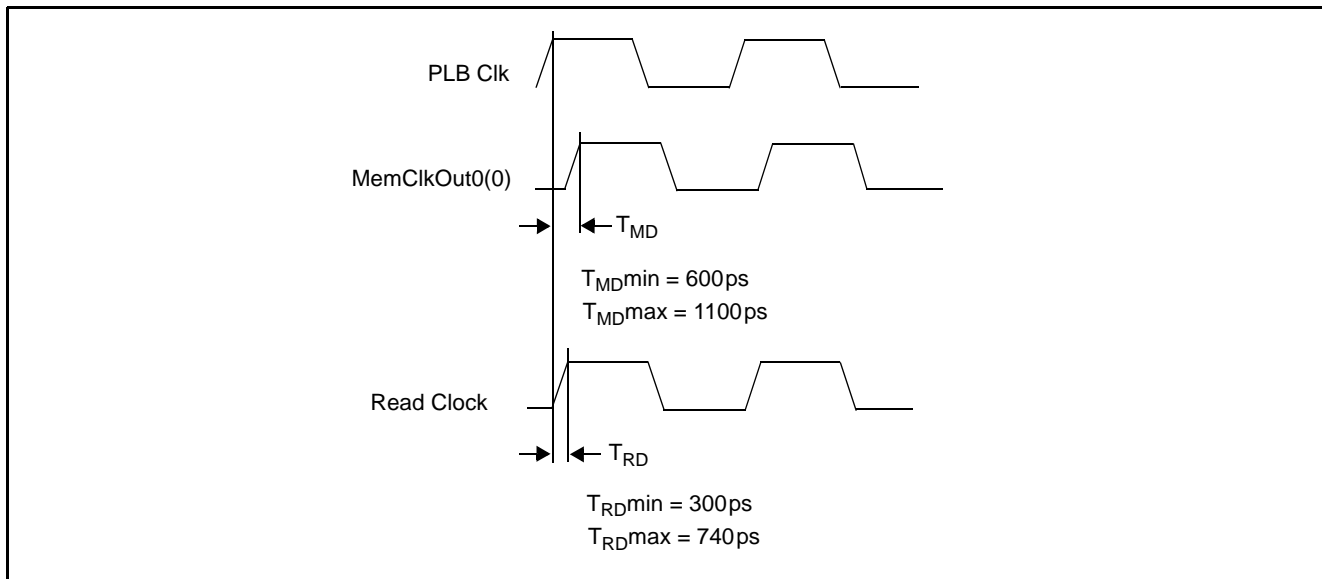

The following examples of timing for DDR SDRAM read operations are based on the relationship between the

**Preliminary Data Sheet**

incoming data and the PLB clock signal. Since the PLB clock cannot be directly observed, the delay of MemClkOut(0) relative to the PLB clock ( $T_{MD}$ ) is provided.

The internal Read Clock signal, like MemClkOut0, is derived from the PLB clock and can be delayed relative to the PLB clock by programming the RDCT and RDCD fields in the SDRAM0\_TR1 register. The delay can be programmed from 0 to 1/2 cycle in steps using RDCT. Setting RDCD results in a 1/2 cycle delay plus the value set in RDCT. The delay of Read Clock relative to the PLB clock ( $T_{RD}$ ) shown below assumes the programmable Read Clock delay is set to zero.

Figure 10. DDR SDRAM MemClkOut0 and Read Clock Delay

In operation, following the receipt of an address and read command from the PPC440GR, the SDRAM generates data and the DQS signals coincident with MemClkOut0. The data is latched into the PPC440GR using a DQS signal that is delayed 1/4 of a cycle. In order to accommodate timing variations introduced by the system designs using this chip, the three-stage data path shown below is used to eliminate metastability and allow data sampling to be adjusted for minimum latency. This adjustment requires programming the Read Clock delay and the selection of Stage 1, Stage 2, or Stage 3 data for sampling at Read Sample Point flipflop (RDSP).

Figure 11. DDR SDRAM Read Data Path

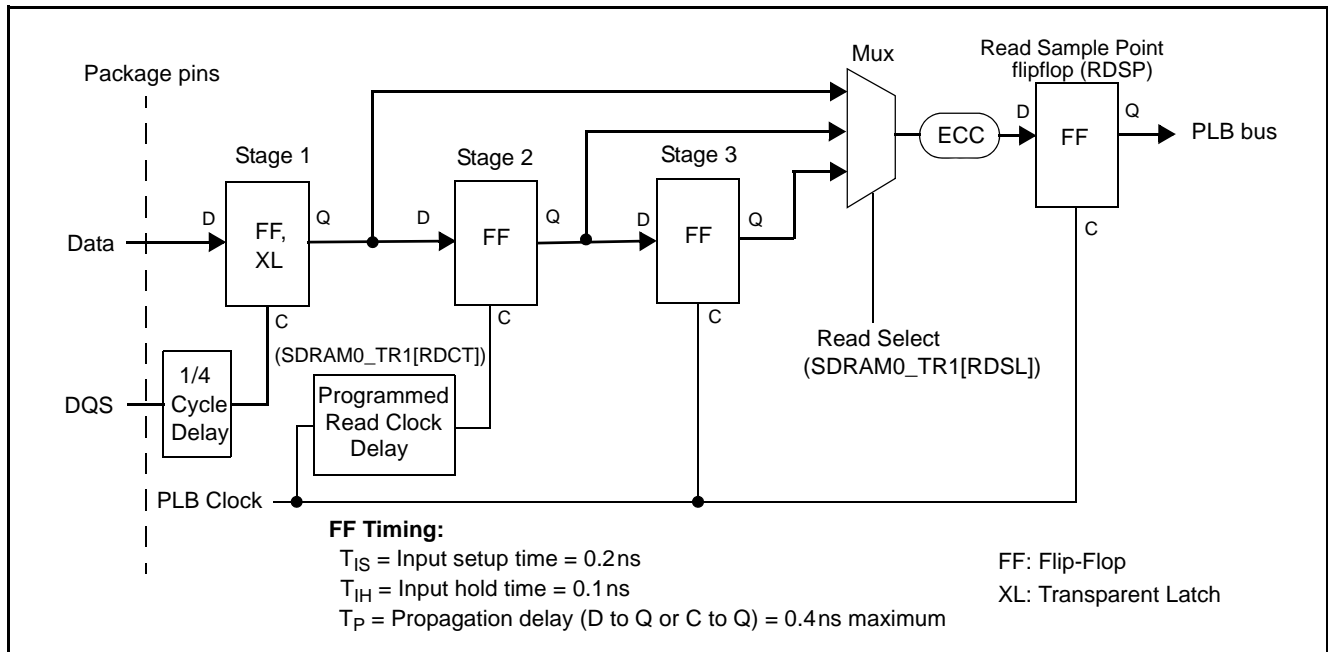

Table 26. I/O Timing—DDR SDRAM  $T_{SIN}$  and  $T_{DIN}$

**Notes:**

1.  $T_{SIN}$  = Delay from DQS at package pin to C on Stage 1 FF.
2.  $T_{DIN}$  = Delay from data at package pin to D on Stage 1 FF.
3. Clock speed for the values in the table is 133MHz.
4. The time values for  $T_{SIN}$  include 1/4 of a cycle at 133MHz (7.5ns x 0.25 = 1.875 ns).

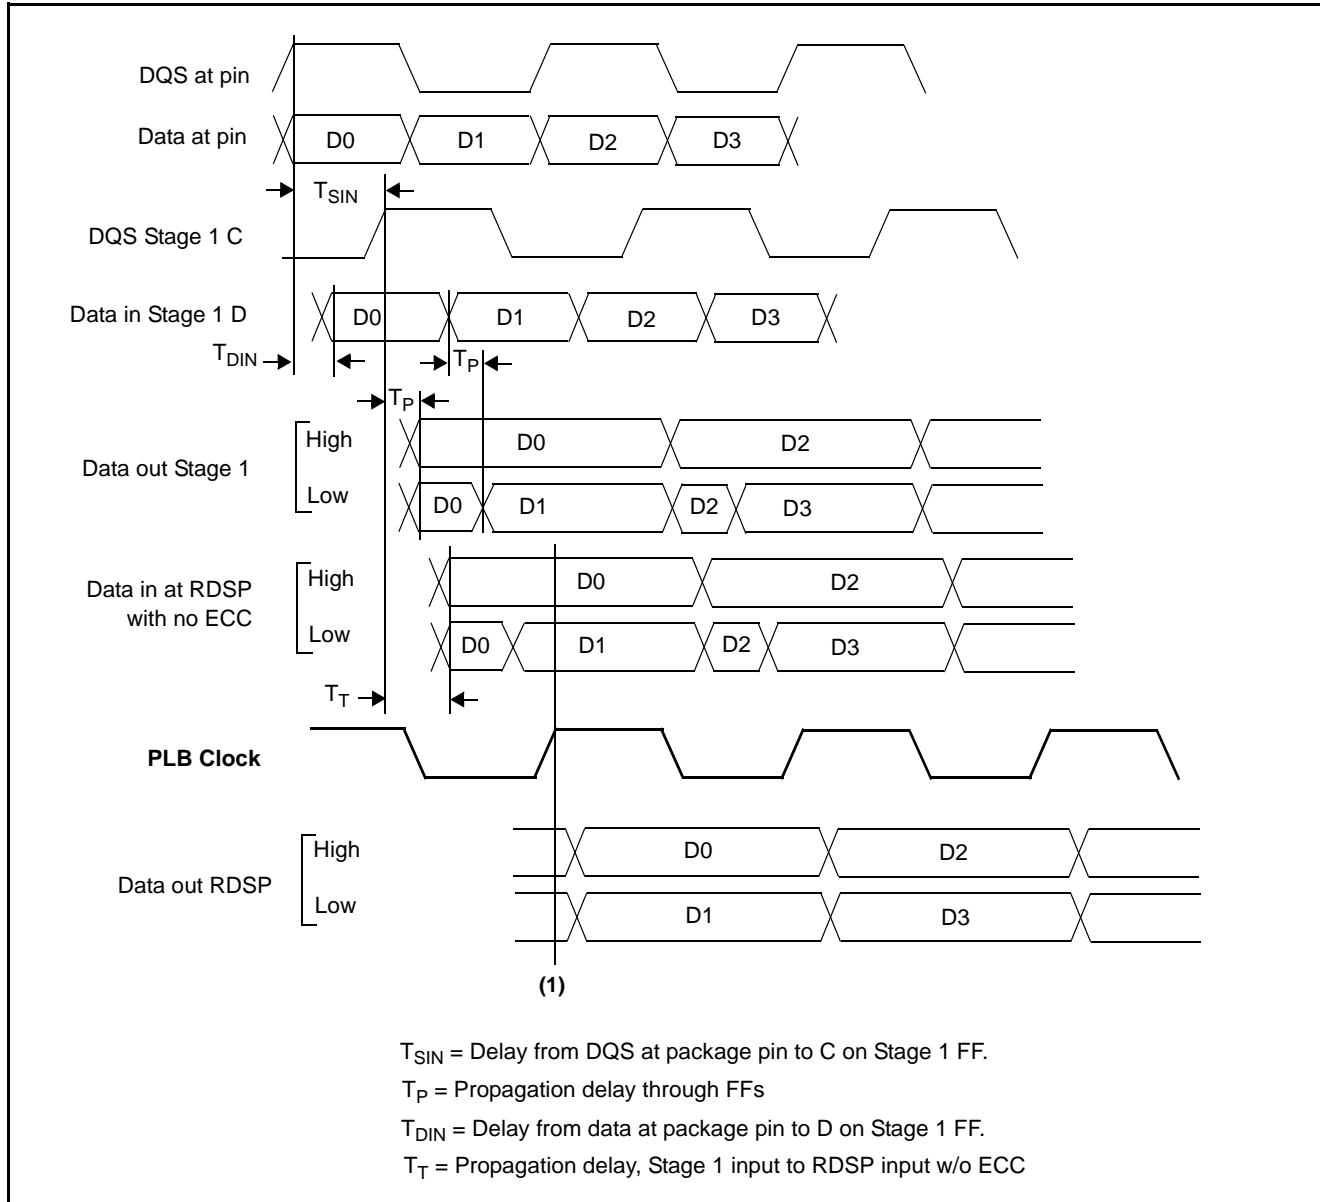

Signal Name	$T_{SIN}$ (ns) minimum	$T_{SIN}$ (ns) maximum	Signal Name	$T_{DIN}$ (ns) minimum	$T_{DIN}$ (ns) maximum
DQS0	2.74	3.70	MemData00:07	0.86	1.87
DQS1	2.75	3.69	MemData08:15	0.87	1.86
DQS2	2.74	3.69	MemData16:23	0.89	1.86
DQS3	2.76	3.69	MemData24:31	0.88	1.85
DQS8	2.77	3.68	ECC0:7	0.89	1.83

In the following examples, the data strobes (DQS) and the data are shown to be coincident. There is actually a slight skew as specified by the SDRAM specifications, and there can be additional skew due to loading and signal routing. It is recommended that the signal length for all of the eight DQS signals be matched.

**Preliminary Data Sheet****Example 1:**

If the data-to-PLB clock timing is as shown in the example below, then the read clock is not delayed and the Stage 1 data is sampled at (1). Except for small, low frequency memory systems with the memory located physically close to the PPC440GR, it is unlikely that Stage 1 data can be sampled. When the data comes later, it is necessary to sample Stage 2 or Stage 3 data. (see Examples 2 and 3). Another way to get the desired data-to-PLB timing to allow Stage 1 sampling is to buffer MemClkOut0 and skew it enough to guarantee the timing. In this example,  $T_T$  is controlled and set by the software.

Figure 12. DDR SDRAM Read Cycle Timing—Example 1

**Example 2:**

In this example Read Clock is delayed almost 1/2 cycle. Without ECC, Stage 2 data can be sampled at (2). If ECC is enabled, Stage 3 data must be sampled (see Example 3). In this example,  $T_T$  and  $T_{TE}$  are controlled and set by the software.

Figure 13. DDR SDRAM Read Cycle Timing—Example 2

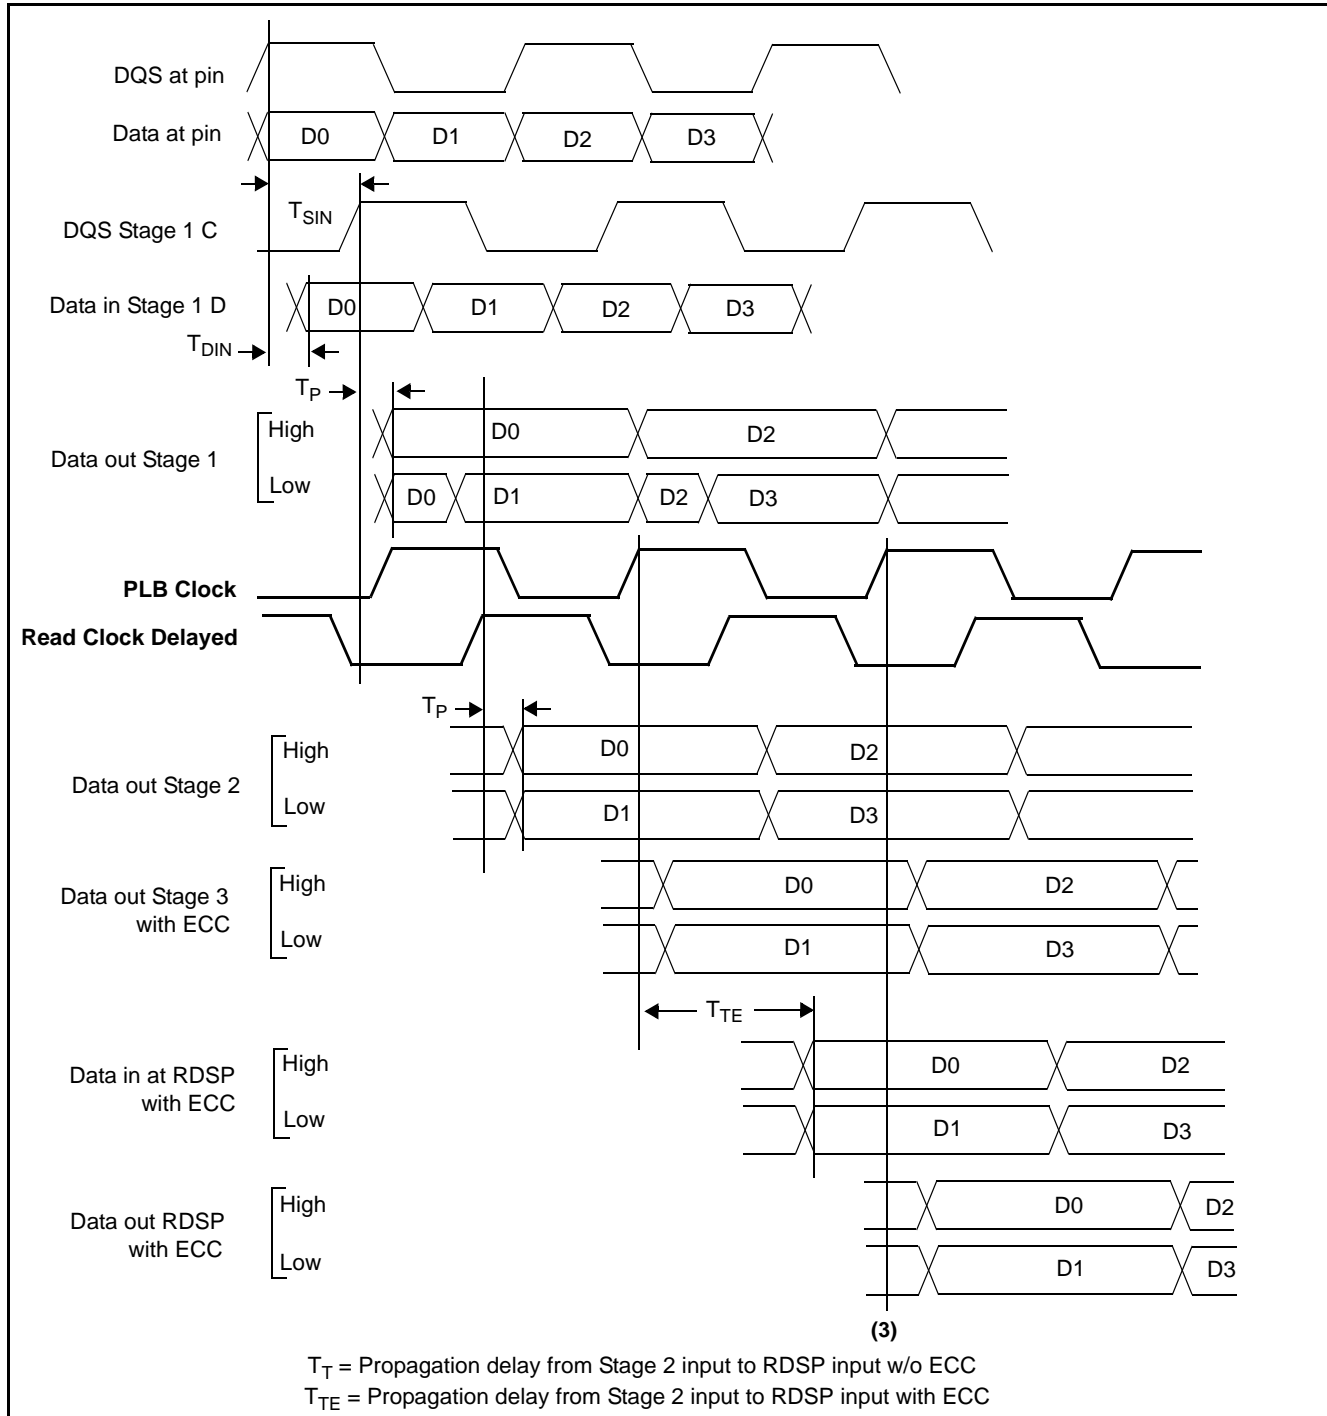

**Preliminary Data Sheet**

**Example 3:**

In this example, ECC is enabled. This requires that Stage 3 data be sampled at (3). If ECC is disabled, the system will still work, but there will be more latency before the data is sampled into RDSP. In this example,  $T_T$  and  $T_{TE}$  are controlled and set by the software.

Figure 14. DDR SDRAM Read Cycle Timing—Example 3

## Initialization

The PPC440GR provides the option for setting initial parameters based on default values or by reading them from a slave PROM attached to the IIC0 bus (see “Serial EEPROM” below). Some of the default values can be altered by strapping on external pins (see “Strapping” below).

## Strapping

While the  $\overline{\text{SysReset}}$  input pin is low (system reset), the state of certain I/O pins is read to enable certain default initial conditions prior to PPC440GR start-up. The actual capture instant is the nearest reference clock edge before the deassertion of reset. These pins must be strapped using external pull-up (logical 1) or pull-down (logical 0) resistors to select the desired default conditions. These pins are used for strap functions only during reset. Following reset they are used for normal functions. The signal names assigned to the pins for normal operation are shown in parentheses following the pin number.

**Note:** To isolate the strapping pins, the  $\overline{\text{ExtReset}}$  signal may be used as a buffer enable or multiplexer select.

The following table lists the strapping pins along with their functions and strapping options:

Table 27. Strapping Pin Assignments

Function	Option	Ball Strapping		
		$\overline{\text{R25}}$ (UART0_DCD)	$\overline{\text{U26}}$ (UART0_DSR)	$\overline{\text{V26}}$ (UART0_CTS)
Serial device is disabled. Each of the six options (A–F) is a combination of boot source, boot-source width, and clock frequency specifications. Refer to the IIC Bootstrap Controller chapter in the <i>PPC440GR Embedded Processor User's Manual</i> for details.	A	0	0	0
	B	0	0	1
	C	0	1	0
	D	0	1	1
	E	1	0	0
	F	1	1	0
Serial device is enabled. The option being selected is the IIC0 slave address that will respond with strapping data. <b>Note:</b> If reading of configuration data from the serial device fails, the PPC440GR defaults to configuration X.	G (0xA8)	1	0	1
	H (0xA4)	1	1	1

## Serial EEPROM

During reset, initial conditions other than those obtained from the strapping pins can be read from a ROM device connected to the IIC0 port. At the de-assertion of reset, if the bootstrap controller is enabled, the PPC440GR sequentially reads 16B from the ROM device on the IIC0 port and sets the SDR0\_SDSTP0, SDR0\_SDSTP1, SDR0\_SDSTP2 and SDR0\_SDSTP3 registers accordingly.

The initialization settings and their default values are covered in detail in the *PowerPC 440GR User's Manual*.

**Preliminary Data Sheet****Revision Log**

Date	Version	Contents of Modification
01/12/2005		Initial creation of document.
01/27/2005		Restore second DMA controller and make PVR and JTAG ID same as 440EP.
01/31/2005		Update DDR SDRAM timing.
03/03/2005		Update I/O definitions. Misc. corrections
03/30/2005		Remove 400MHz and 466MHz part numbers.
04/18/2005		Remove reference to USB end points.
04/28/2005		Update DDR SDRAM timing.
05/09/2005		Update reserved signals and add description of TmrClk2.
05/18/2005		Correct specs regarding the frequency range allowed for TmrClk2.
06/06/2005	1.08	Change description of TmrClk2.
07/11/2005	1.09	Add RoHS compliance statement and change maximum NAND Flash to 256MB.
07/20/2005		Misc. changes.
08/05/2005		Change solder ball size specification.
09/21/2005		Add power dissipation values for all supply voltages at the CPU speeds supported.
09/22/2005	1.10	Transfer applicable data (input capacitance, thermal performance, etc.) from 400EP data sheet.
10/06/2005	1.11	Misc. changes.
10/10/2005	1.12	Add 400Mhz CPU speed back into available PN list.
11/18/2005	1.13	Add default configuration X when bootstrap IIC read fails to Table 27. Add package nomenclature. Correct MemClkOut duty cycle. Correct description and move PerErr signal from master to slave. Change maximum VCO frequency to 1334MHz.
02/16/2006	1.14	Add revision level B (1.1) part numbers and PVR numbers.
05/24/2006	1.15	Update power dissipation and add additional temperature data.
07/19/2006	1.16	Correct enable/disable specifications for PCI Gnt/Req signals.

Date	Version	Contents of Modification
12/03/2007	1.17	<p>Change analog voltage filter circuit inductor part number.</p> <p>Change all multiplexed GPIO signal defaults to the GPIO signals.</p> <p>Change AC12 default from IRQ5 to DMAREq1.</p> <p>Correct descriptions of LeakTest, RcvrInh, ModeCtrl, RefEn, and DrvrInh1:2 signals.</p> <p>Added Assembly Requirements section on page 17, added Unused I/Os section on page 50, placed the analog filter diagram in its own section.</p> <p>Added changes to the Internal Buses, changes to Assembly Requirements, moved diagram from under Device Characteristics to Power Sequencing and added more information, added information to DDR SDRAM Read Data Path Diagram, added information to Test Condition and I/O Specifications diagrams.</p> <p>Changed the technical support telephone and fax number.</p> <p>Changed temperature rating for 333MHz and 400MHz parts on page 4 as per Product Change Notification: 091207-01.</p> <p>Added note for EMCSync signal to I/O Specification table.</p> <p>Added timing references to I/O Specification tables.</p> <p>Corrected setup and hold timing for RejectPK in I/O Specification table.</p> <p>Added definition for RDSP abbreviation to DDR SDRAM Read Data Path figure.</p> <p>Added notes 3 and 4 to Recommended DC Operating Conditions table.</p> <p>Added Overshoot/Undershoot specification.</p>
03/18/2008	1.18	<p>Replaced 16750 compatible UART to 16550</p> <p>Replaced NS16750 with NS16550.</p>
05/07/2008	1.19	Deleted incorrect MDIO timing data from table 20.
