Functional Description

The G218A combines LVD and SE termination with DIFFSENS sourcing and detection. The LVD termination section consists of two source/sink amplifiers (VTOP, VBOT), biasing circuitry and nine precision resistor strings (RTOP, RMID, RBOT). The SE termination section consists of a 2.85V source/sink regulator with 9 precision 110ohm resistor. The DIFFSENSE section consists of a 1.3V, 5mA driver and a sensing circuit (Figure 1)

DIFFSENSE is used by multi-mode transceiver (LVD/SE) to determine if the device is connected to a single-ended, LVD or HVD SCSI bus. If the voltage on DIFFSENSE is between 0-0.5V the bus is single-ended; if it is between 0.7-1.9V the bus is LVD; and if it is greater than 2.4V, the bus is HVD.

The G218A DIFFB pin monitors the DIFFSENS line to determine the proper operating mode of the device; this mode is indicated by the SE/LVD/HVD outputs.

HVD Isolation Mode The G218A identifies that there is an HVD (high voltage differential) device on the SCSI bus and isolates the termination pins from the bus.

When DISCNCT=1, the termination pins are isolated from the SCSI bus, and the bus mode indicators (SE/LVD/HVD) as well as VREF remains active. During thermal shutdown, the termination pins are isolated from the SCSI bus and VREF becomes high impedance. The DIFFSENSE driver is shut down during either of these two events.

To ensure proper operation, the TPWR pin should be connected to the SCSI bus TERMPWR line. As with all analog circuitry, the TERMPWR and VDD lines should be bypassed locally. A 2.2µF capacitor and a 0.01µF high frequency capacitor is recommended between TPWR and ground and placed as close as possible to the G218A. The G218A should be placed as close as possible to the SCSI connector to minimize signal and

The DIFFSENSE pin can also drive the SCSI DIFFSENS line (when M/S=1) to determine the SCSI bus operating mode. The G218A switches to the termination mode that is appropriate for the bus based on the value of the DIFFSENS voltage. These modes are:

LVD mode LVD termination is provided by a precision resistor string with two amplifiers. This configuration yields a 105Ω differential and 150Ω common mode impedance. A fail safe bias of 112mV is maintained when no drivers are connected to the SCSI bus.

SE mode When the external driver for a given signal line turns off, the active terminator will pull that signal line to 2.85 volts (quiescent state). When used with an active negation driver, the power amp can sink 22mA per line.

while keeping the voltage reference in regulation. The terminating resistors maintain their 110Ω value.

power trace length, thereby resulting in less input capacitance and reflections which can degrade the bus signals.

To maintain the specified regulation, a 4.7µF capacitor is required between the VREF pin and ground of each G218A. A high frequency cap (0.1µF ceramic recommended) can also be placed on the VREF pin in applications that use fast rise/fall time drivers. A typical SCSI bus configuration is shown in Figure2.

An internal pull down resistor assures that the G218A will be terminating the bus if the DISCNCT pin is left floating.

Note:

DIFFSENS—Refers to the SCSI bus signal.

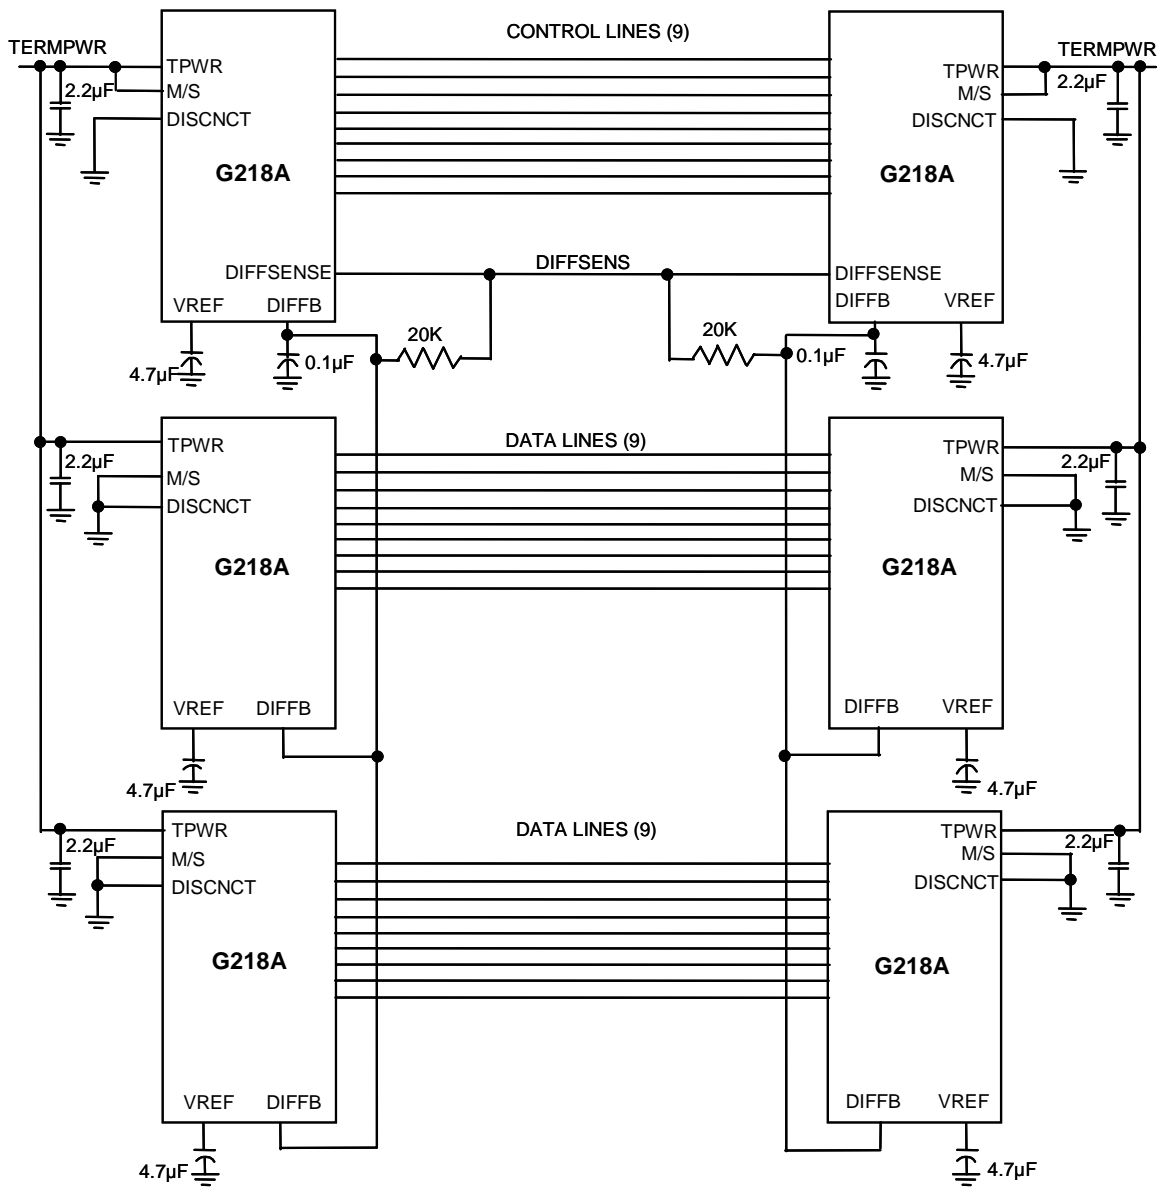

DIFFSENSE—Refers to the G218A pin name and internal circuitry relating to differential sensing.

DIFFB—Refers to the G218A pin name and internal circuitry relating to monitoring the DIFFSENS line.

SCSI Bus Configuration (Figure 2)

Pin Description (for 28pin SSOP)

PIN	SYMBOL	DESCRIPTION
1	VREF*	Reference Voltage. 2.85-volt reference; a regulator bypass, must be connected to a 4.7 μ F capacitor.
2-5,7-12, 18-21, 23-26	Rx+, Rx-	Signal Termination. (X=1,2,3,.....9) Rx+: Ground line for single-ended or positive line for differential applications for the SCSI bus. Rx-: Signal line/active line for single-ended or negative line in differential applications for the SCSI bus.
6,22	NC	No Connect. Do not connect these pins.
13	DISCNCT	Disconnect. When pulled high, the G218 isolates its bus pins (Rx+, Rx-) from the SCSI bus.
14	GND	Ground. Terminator ground pin. Connected to ground.
15	M/S	Master/slave. Used to select which terminator is the controlling device. M/S pin high enables the DIFFSENSE driver.
16	DIFFSENSE	Output to drive the SCSI bus DIFFSENS line.
17	DIFFB	DIFFB pin should be connected to a 0.1 μ F capacitor to GND and 20k resistor to SCSI/Bus DIFFSENS line. An input pin to detect the type of device (differential or single-ended) on the SCSI bus.
27,28	TPWR	Terminator Power. Connect to the SCSI TERMPWR line and de-couple with a 2.2 μ F capacitor.

*The VREF keeps the level at 2.85 volt, despite the DISCNCT pin is asserted or not; even the termination mode is changed.

(36pin SSOP)

PIN	SYMBOL	DESCRIPTION
1	VREF*	Reference Voltage. 2.85-volt reference; a regulator bypass, must be connected to a 4.7 μ F capacitor.
2,3	NC	No Connect. Do not connect these pins.
4-7,11-16, 22-25, 29-32	Rx+ Rx-	Signal Termination. (X=1,2,3,.....9) Rx+: Ground line for single-ended or positive line for differential applications for the SCSI bus. Rx-: Signal line/active line for single-ended or negative line in differential applications for the SCSI bus.
8, 9,10,26, 27,28	HS/GND	Heat Sink Ground. Connect to large area PC board traces to increase power dissipation capability.
17	DISCNCT	Disconnect. When pulled high, the G218 isolates its bus pins (Rx+, Rx-) from the SCSI bus.
18	GND	Ground. Terminator ground pin. Connected to ground.
19	M/S	Master/slave. Mode select for the non controlling terminator. MSTR enables the DIFFSENSE driver.
20	DIFFSENSE	Output to drive the SCSI bus DIFFSENS line.
21	DIFFB	DIFFB pin should be connected to a 0.1 μ F capacitor to GND and 20k resistor to SCSI/Bus DIFFSENS line. An input pin to detect the type of device (differential or single-ended) on the SCSI bus.
33	SE	Single ended mode indicator. It is HIGH when terminator is operating in SE mode.
34	LVD	Low Voltage Differential mode indicator. It is HIGH when terminator is operating in LVD mode.
35	HVD	High Voltage Differential mode indicator. It is HIGH when terminator is operating in HVD mode or thermal shutdown.
36	TPWR	Terminator Power. Connect to SCSI bus TERMPWR line and decouple with 2.2 μ F capacitor.

*The VREF keeps the level at 2.85 volt, despite the DISCNCT pin is asserted or not; even the termination mode is changed.
