### Functional Description

The CY7C194, CY7C195, and CY7C196 are high-performance CMOS static RAMs organized as 65,536 by 4 bits. Easy memory expansion is provided by active LOW chip enable(s) ( $\overline{CE}$  on the CY7C194 and CY7C195,  $\overline{CE}_1$ ,  $\overline{CE}_2$  on the CY7C196) and three-state drivers. They have an automatic power-down feature, reducing the power consumption by 75% when deselected.

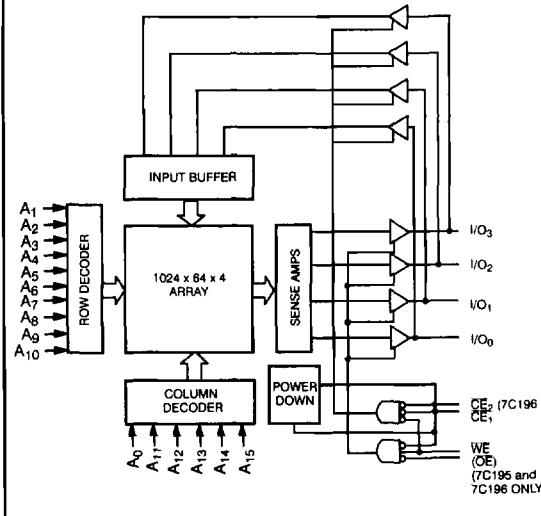

Writing to the device is accomplished when the chip enable(s) ( $\overline{CE}$  on the CY7C194 and CY7C195,  $\overline{CE}_1$ ,  $\overline{CE}_2$  on the CY7C196) and

write enable ( $\overline{WE}$ ) inputs are both LOW. Data on the four input pins ( $I/O_0$  through  $I/O_3$ ) is written into the memory location, specified on the address pins ( $A_0$  through  $A_{15}$ ).

Reading the device is accomplished by taking the chip enable(s) ( $\overline{CE}$  on the CY7C194 and CY7C195,  $\overline{CE}_1$ ,  $\overline{CE}_2$  on the CY7C196) LOW, while write enable ( $\overline{WE}$ ) remains HIGH. Under these conditions the contents of the memory location specified on the address pins will appear on the four data I/O pins.

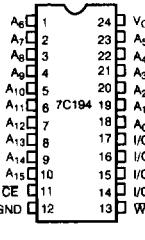

A die coat is used to ensure alpha immunity.

#### Notes:

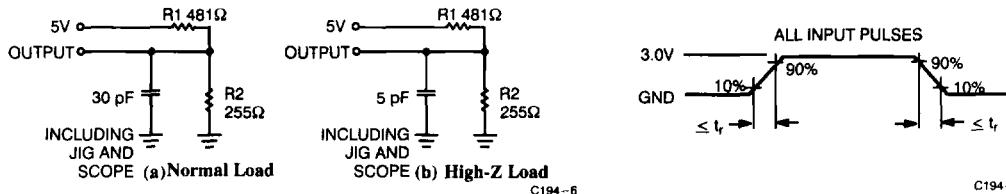

1. Minimum voltage is equal to  $-2.0\text{V}$  for pulse durations of less than 20 ns.
2.  $T_A$  is the "instant on" case temperature.
3. See the last page of this specification for Group A subgroup testing information.
4. Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
5. A pull-up resistor to  $\text{V}_{\text{CC}}$  on the  $\overline{\text{CE}}$  input is required to keep the device deselected during  $\text{V}_{\text{CC}}$  power-up, otherwise  $\text{I}_{\text{SB}}$  will exceed values given.

**Notes:**

- 8. Test conditions assume signal transition time of 3 ns or less for -12 and -15 speeds and 5 ns or less for -20 and slower speeds, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I<sub>OH</sub>/I<sub>OL</sub> and 30-pF load capacitance.
- 9. At any given temperature and voltage condition, t<sub>HZCE</sub> is less than t<sub>LZCE</sub> and t<sub>HZWE</sub> is less than t<sub>LZWE</sub> for any given device.
- 10. t<sub>HZOE</sub>, t<sub>HZCE</sub>, and t<sub>HZWE</sub> are specified with C<sub>L</sub> = 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady-state voltage.
- 11. The internal write time of the memory is defined by the overlap of CE<sub>1</sub> LOW, CE<sub>2</sub> LOW, and WE LOW. All signals must be LOW to initiate a write and any signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

Write Cycle No. 1 ( $\overline{CE}$  Controlled)<sup>[11, 15, 16]</sup>

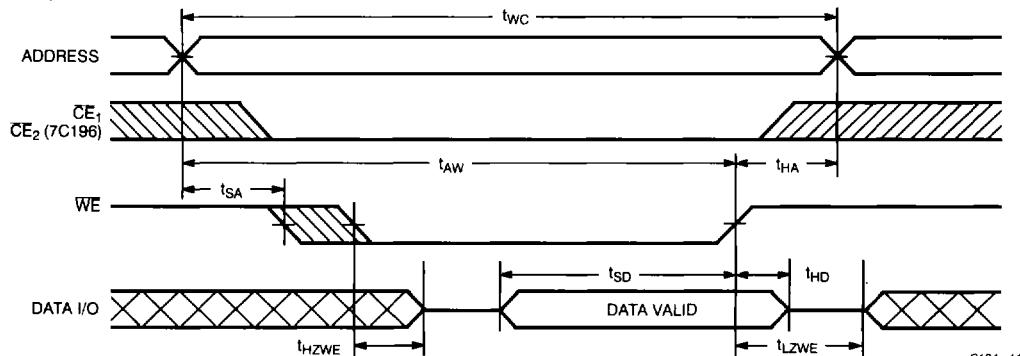

C194-10

**Notes:**

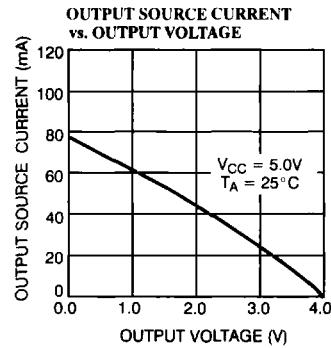

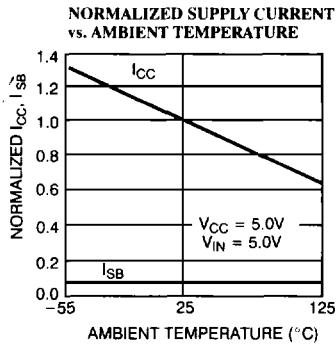

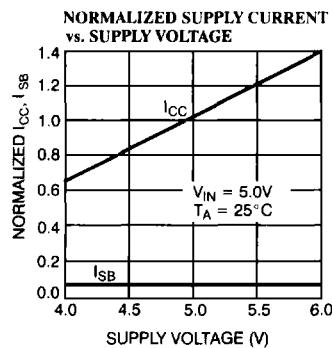

12.  $WE$  is HIGH for read cycle.
13. Device is continuously selected:  $\overline{CE}_1 = V_{IL}$ ,  $\overline{CE}_2 = V_{IL}$  (7C196), and  $\overline{OE} = V_{IL}$  (7C195 and 7C196).
14. Address valid prior to or coincident with  $\overline{CE}_1$  and  $\overline{CE}_2$  transition LOW.
15. Data I/O will be high impedance if  $\overline{OE} = V_{IH}$  (7C195 and 7C196).
16. If any  $\overline{CE}$  goes HIGH simultaneously with  $WE$  HIGH, the output remains in a high-impedance state.
17. The minimum write cycle time for Write Cycle No. 3 ( $WE$  controlled,  $\overline{OE}$  LOW) is the sum of  $t_{HZWE}$  and  $t_{SD}$ .
