

### Features

- 32768 x 8 bit static CMOS RAM
- 35 and 55 ns Access Time
- Common data inputs and data outputs
- Three-state outputs
- Typ. operating supply current
  - 35 ns: 45 mA
  - 55 ns: 30 mA
- Standby current < 50  $\mu$ A at 125 °C
- TTL/CMOS-compatible
- Power supply voltage 5 V
- Operating temperature range
  - 40 °C to 85 °C
  - 40 °C to 125 °C
- QS 9000 Quality Standard
- ESD protection > 2000 V (MIL STD 883C M3015.7)
- Latch-up immunity >100 mA
- Package: SOP28 (300/330 mil)

### Description

The U62H256A is a static RAM manufactured using a CMOS process technology with the following operating modes:

- Read
- Write
- Standby
- Data Retention

The memory array is based on a 6-transistor cell.

The circuit is activated by the falling edge of  $\overline{E}$ . The address and control inputs open simultaneously. According to the information of  $\overline{W}$  and  $\overline{G}$ , the data inputs, or outputs, are active. In a Read cycle, the data outputs are activated by the falling edge of  $\overline{G}$ , afterwards the data word will be available at the outputs DQ0-DQ7. After the address change, the data outputs

go High-Z until the new information is available. The data outputs have no preferred state. The Read cycle is finished by the falling edge of  $\overline{W}$ , or by the rising edge of  $\overline{E}$ , respectively.

Data retention is guaranteed down to 2 V. With the exception of  $\overline{E}$ , all inputs consist of NOR gates, so that no pull-up/pull-down resistors are required.

## Characteristics

All voltages are referenced to  $V_{SS} = 0$  V (ground).

All characteristics are valid in the power supply voltage range and in the operating temperature range specified.

Dynamic measurements are based on a rise and fall time of  $\leq 5$  ns, measured between 10 % and 90 % of  $V_I$ , as well as input levels of  $V_{IL} = 0$  V and  $V_{IH} = 3$  V. The timing reference level of all input and output signals is 1.5 V, with the exception of the  $t_{dis}$ -times and  $t_{en}$ -times, in which cases transition is measured  $\pm 200$  mV from steady-state voltage.

<sup>a</sup> Stresses greater than those listed under „Absolute Maximum Ratings“ may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability

<sup>b</sup> Maximum voltage is 7 V

<sup>c</sup> Not more than 1 output should be shorted at the same time. Duration of the short circuit should not exceed 30 s.
