■ TECHNICAL NOTES

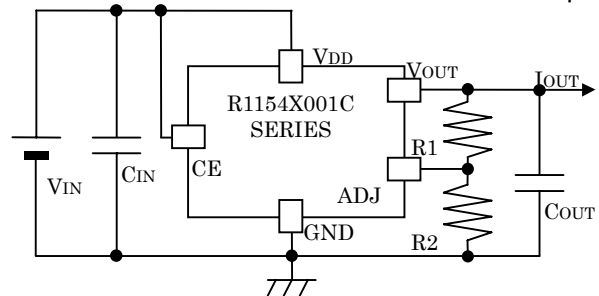

Phase Compensation

Phase Compensation of the R1154 Series has been made internally for stable operation even though the load current would vary. Therefore, without the capacitors, C_{IN} and C_{OUT} , the output voltage is regulated, however, for more stable operation, use capacitors as C_{IN} and C_{OUT} . Especially, if the input line is long and impedance is high, C_{IN} is necessary, moreover, if you use C_{OUT} , transient response will be improved. Recommended value is in the range from $0.1\mu\text{F}$ to $2.2\mu\text{F}$. Wiring should be made as short as possible.

Connect the capacitor, C_{IN} between VDD pin and GND pin and C_{OUT} between VOUT and GND as close as possible.

R1154XxxxB Typical Application

R1154XxxxC Typical Application

Thermal Shutdown

Thermal shutdown function is included in the R1154 Series, if the junction temperature is equal or more than +150°C (Typ.), the operation of regulator would stop. After that, when the junction temperature is equal or less than +125°C (Typ.), the operation of regulator would restart. Unless the cause of rising temperature would remove, the regulator repeats on and off, and output waveform would be like consecutive pulses.

Chip Enable Circuit

Do not make voltage level of chip enable pin keep floating level, or in between V_{IH} and V_{IL} . Unless otherwise, Output voltage would be unstable or indefinite, or unexpected current would flow internally.
