

## 4GB – 2x256Mx72 DDR SDRAM REGISTERED ECC, w/PLL

### FEATURES

- Double-data-rate architecture
- DDR200, DDR266, and DDR333
- Bi-directional data strobes (DQS)
- Differential clock inputs (CK & CK#)
- Programmable Read Latency 2,2.5 (clock)
- Programmable Burst Length (2,4,8)
- Programmable Burst type (sequential & interleave)
- Edge aligned data output, center aligned data input.
- Auto and self refresh
- Serial presence detect
- Dual Rank
- Power supply:  $V_{CC} = 2.5V \pm 0.2V$
- JEDEC standard 184 pin DIMM package
  - Package height options:
    - JD3: 30.48mm (1.2"),
    - AJD3: 28.70mm (1.13")
    - BJD3: 28.70mm (1.13")

NOTE: Consult factory for availability of:

- RoHS compliant products
- Vendor source control options
- Industrial temperature option

### DESCRIPTION

The W3EG2256M72ASSR is a 2x256Mx72 Double Data Rate SDRAM memory module based on 1Gb DDR SDRAM components. The module consists of eighteen 512Mx4 stacks, in 66 pin TSOP packages mounted on a 184 pin FR4 substrate.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges and Burst Lengths allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

## FUNCTIONAL BLOCK DIAGRAM

Note: All resistor values are 22 ohms unless otherwise specified.

### NOTES:

- DQ-to-I/O wiring is shown as recommended but may be changed.
- DQ/DQS/DM/CKE/S relationships must be maintained as shown.

**ABSOLUTE MAXIMUM RATINGS**

Parameter	Symbol	Value	Units
Voltage on any pin relative to V <sub>SS</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-0.5 - 3.6	V

Notes

1. All voltages referenced to  $V_{SS}$
2. Tests for AC timing,  $I_{DD}$ , and electrical AC and DC characteristics may be conducted at normal reference / supply voltage levels, but the related specifications and device operations are guaranteed for the full voltage range specified.
3. Outputs are measured with equivalent load:

4. AC timing and  $I_{DD}$  tests may use a  $V_{IL}$ -to- $V_{IH}$  swing of up to 1.5V in the test environment, but input timing is still referenced to  $V_{REF}$  (or to the crossing point for CK/CK#), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals used to test the device is 1V/ns in the range between  $V_{IL}(AC)$  and  $V_{IH}(AC)$ .
5. The AC and DC input level specifications are defined in the SSTL\_2 standard (i.e., the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above [below] the DC input LOW [high] level).
6. For slew rates less than 1V/ns and greater than or equal to 0.5V/ns. If the slew rate is less than 0.5V/ns, timing must be derated:  $t_{IS}$  has an additional 50ps per each 100mV/ns reduction in slew rate from the 500mV/ns.  $t_{IH}$  has 0ps added, that is, it remains constant. If the slew rate exceeds 4.5V/ns, functionality is uncertain. For 266, slew rates must be greater than or equal to 0.5V/ns.
7. Inputs are not recognized as valid until  $V_{REF}$  stabilizes. Exception: during the period before  $V_{REF}$  stabilizes,  $CKE \leq 0.3 \times V_{CCQ}$  is recognized as LOW.
8.  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ) and begins driving (LZ).
9. The intent of the “Don’t Care” state after completion of the postamble is the DQS-driven signal should either be HIGH, LOW, or high-Z, and that any signal transition within the input switching region must follow valid input requirements. That is, if DQS transitions HIGH (above  $V_{IHDC}$  (MIN)) then it must not transition LOW (below  $V_{IHDC}$ ) prior to  $t_{DQSH}$  (MIN).
10. This is not a device limit. The device will operate with a negative value, but system performance could be degraded due to bus turnaround.
11. It is recommended that DQS be valid (HIGH or LOW) on or before the WRITE command. The case shown (DQS going from High-Z to logic LOW) applies when no WRITES were previously in progress on the bus. If a previous WRITE was in progress, DQS could be high during this time, depending on  $t_{DQSS}$ .
12. The refresh period is 64ms. This equates to an average refresh rate of 7.8125 $\mu$ s. However, an AUTO REFRESH command must be asserted at least once every 70.3 $\mu$ s; burst refreshing or posting by the DRAM controller greater than eight refresh cycles is not allowed.
13. The valid data window is derived by achieving other specifications -  $t_{HP}$  ( $t_{CK/2}$ ),  $t_{DQSQ}$ , and  $t_{QH}$  ( $t_{QH} = t_{HP} - t_{QHS}$ ). The data valid window derates directly proportional with the clock duty cycle and a practical data valid window can be derived. The clock is allowed a maximum duty cycled variation of 45/55. Functionality is uncertain when operating beyond a 45/55 ratio. The data valid window derating curves are provided below for duty cycles ranging between 50/50 and 45/55.
14. Referenced to each output group:  $x4 = DQS$  with DQ0-DQ3.
15. READs and WRITEs with auto precharge are not allowed to be issued until  $t_{RAS}$  (MIN) can be satisfied prior to the internal precharge command being issued.
16. JEDEC specifies CK and CK# input slew rate must be  $\geq 1V/ns$  (2V/ns differentially).
17. DQ and DM input slew rates must not deviate from DQS by more than 10%. If the DQ/DM/DQS slew rate is less than 0.5V/ns, timing must be derated: 50ps must be added to  $t_{DS}$  and  $t_{DH}$  for each 100mV/ns reduction in slew rate. If slew rates exceed 4V/ns, functionality is uncertain.
18.  $t_{HP}$  min is the lesser of  $t_{CL}$  min and  $t_{CH}$  min actually applied to the device CK and CK# inputs, collectively during bank active.
19.  $t_{HZ}$  (MAX) will prevail over the  $t_{DQSQ}$  (MAX) +  $t_{RPST}$  (MAX) condition.  $t_{LZ}$  (MIN) will prevail over  $t_{DQSQ}$  (MIN) + PRE (MAX) condition.
20. For slew rates greater than 1V/ns the (LZ) transition will start about 310ps earlier.
21. CKE must be active (High) during the entire time a refresh command is executed. That is, from the time the AUTO REFRESH command is registered, CKE must be active at each rising clock edge, until  $t_{RFC}$  has been satisfied.
22. Whenever the operating frequency is altered, not including jitter, the DLL is required to be reset. This is followed by 200 clock cycles (before READ commands).

## ORDERING INFORMATION FOR JD3

### NOTES:

- Vendor specific part numbers are used to provide memory components source control. The place holder for this is shown as lower case "x" in the part numbers above and is to be replaced with the respective vendors code. Consult factory for qualified sourcing options. (M = Micron, S = Samsung & consult factory for others)
- Consult factory for availability of industrial temperature (-40°C to 85°C) option
- For part numbering interpretation, please see "part numbering guide" on page 13
